#### Abstract

This thesis consists of a study of expansions in some subcategories of the category $\mathscr{S}_{\mathrm{X}}$ of semigroups. In particular, we consider expansions in the category $\mathscr{S}_{\mathbf{x}}{ }^{*}$ of quotients of the free semigroup on X .

The first chapter includes an introduction to the subject of the thesis and a brief resume of the results.

The second chapter contains some background and preliminaries for the succeeding chapters.

In the third chapter we first develop the concept of contractions on the lattice $\Gamma(\mathrm{X})$ of congruences on the free semigroup on X and then we show that there exist mappings $\varphi$ and $\psi$ between the set of contractions in $\Gamma(X)$ and the set of expansions in $\mathscr{S}_{\mathbf{x}} *$ which are inverse order anti-isomorphisms, and we give these mappings explicitly. We also give some basic properties of these lattices.

The fourth chapter consists of the characterization of some special expansions in terms of contractions and the explicit definitions of the joins and the meets of some known expansions.

In the final chapter we characterize the expansions in the category of monogenic semigroups and we also give results related to the lattice of these expansions such as the order in this lattice and the compatibility of these lattice operations with multiplication.

## ACKNOWLEDGEMENTS

This thesis was written under the supervision of Dr. N. R. Reilly who introduced the concept of contractions in lattices of congruences as a tool for the study of expansions.

I would like to thank my supervisor Dr. N. R. Reilly for his guidance during the preparation of this thesis.

I would also like to express my gratitude to Dr. M. Petrich to whom I owe my interest in the theory of semigroups and many other things.

I finally thank my dearest friend M. E. Imren for his encouragement, patience and help during this work and in particular during the typing of this thesis.

## CHAPTER 1

## Introduction.

From the point of view of the theory of semigroups, it is natural that one should want to consider for a given semigroup $S$ those semigroups $\bar{S}$ for which there is a natural epimorphism $\eta_{S}: \bar{S} \rightarrow S$; that is, $S$ is a homomorphic image of $\overline{\mathrm{S}}$, and such that $\overline{\mathrm{S}}$ is close to the particular semigroup S . More precisely, we are interested in functors F , from special categories of semigroups and morphisms into special categories of semigroups and morphisms. Such a functor $F$, is called an expansion if in addition there exists a natural transformation $\eta$ from the functor $F$ to the identity functor such that each $\eta_{\mathrm{s}}$ is surjective.

So, given a semigroup $S$, we are interested in the situation where there exists an expanded semigroup $F(S)$ and an epimorphism $\eta_{S}: F(S) \rightarrow S$; given a morphism $\varphi: S \rightarrow T$, there exists a morphism $F(\varphi): F(S) \rightarrow F(T)$; if $\varphi$ is surjective, $\mathrm{F}(\varphi)$ should also be surjective; and (functorially) if $\imath$ is the identity function of $S$, then $F(\mathfrak{l})$ is the identity of $F(S)$, and if $S \xrightarrow{\varphi} \mathrm{~T} \xrightarrow{\Psi} \mathrm{U}$ then $\mathrm{F}(\Phi \circ \Psi)=\mathrm{F}(\Phi) \circ \mathrm{F}(\Psi)$; morover the following diagram commutes :

This thesis is devoted to the investigation of expansions in the category $\mathscr{S}_{\mathrm{x}}$ and its subcategories. In order to do that, the concept of a contraction in Con $\mathrm{X}^{+}$is introduced.

We begin in Chapter 2 by giving the appropriate background for the Chapters 3,4 and 5 . For a general introduction to the theory of semigroups, the reader is referred to [4], [6] or [9].

In the third chapter we start with the definition of an expansion in $\mathscr{S}_{\mathbf{x}}$ and we introduce the subcategory $\mathscr{S}_{\mathrm{x}}{ }^{*}$ of $\mathscr{S}_{\mathrm{x}}$, and we prove that every expansion in $\mathscr{S}_{\mathrm{x}}$ is congruent to an expansion in $\mathscr{S}_{\mathrm{x}}^{*}$ in order to work only in $\mathscr{S}_{\mathrm{x}}{ }^{*}$. We then describe the concept of a contraction in ConX ${ }^{+}$and we give the order on the set of contractions in Con $\mathrm{X}^{+}, \mathscr{C}$, which is shown to be a lattice. We also introduce the expansions in $\mathscr{S}_{\mathrm{x}}{ }^{*}$ based on contractions in $\mathrm{Con} \mathrm{X}^{+}$and conversely the contractions in $\mathrm{Con} \mathrm{X}^{+}$based on expansions in $\mathscr{S}_{\mathrm{x}}{ }^{*}$. Finally, we give two mappings, $\Psi$ and $\Phi$, from the set of expansions in $\mathscr{S}_{\mathrm{x}}{ }^{*}, \mathscr{E}$, onto $\mathscr{E}$, and from $\mathscr{C}$ onto $\mathscr{E}$, respectively. The main result of this chapter is the fact that these mappings are order anti-isomorphisms and consequently, we define a partial order on $\mathscr{E}$ which is then viewed as a lattice. We also show that $\mathscr{E}$ and $\mathscr{E}$ form as well semigroups with composition as multiplication and that $\Psi$ and $\Phi$ are also semigroup isomorphisms. The last result of this chapter concerns the compatibility of the product and the join of two expansions, and is illustrated by an example.

In Chapter 4 we consider some known expansions. The first section is devoted to the machine expansion $\overline{\mathrm{S}}^{\boldsymbol{\varphi}}$. We begin by introducing a congruence $\bar{\rho}^{\varphi}$
and a contraction $f: \rho \rightarrow \bar{\rho}^{\boxed{y}}$. We also give an isomorphism $\varphi$ from the free semigroup on $X, X^{+}$, modulo $\rho$ to the cutdown to generators $A$ of the left machine expansion on $X^{+} / \rho$. We close this section by proving that $\Phi(f)$ is congruent to the left machine expansion cutdown to generators. In the second section we turn our attention to an expansion based on the machine expansion, $\widetilde{S}^{\mathscr{L}}$, and we introduce a congruence $\tilde{\rho}^{\mathscr{L}}$ and a contraction $l: \rho \rightarrow \widetilde{\rho}^{\mathscr{L}}$. We give an isomorphism $\varphi$ from $X^{+} / \rho^{\varphi}$ to the cutdown to generators $A$ of the expansion $\left(\widetilde{\mathrm{X}^{+} / \rho}\right)^{\mathscr{P}}$. We end by proving that $\Phi(l)$ is congruent to the expansion L which maps $X^{+} / \rho$ to the cutdown to generators $A$ of the expansion $\left(\widetilde{\mathrm{X}^{+} / \rho}\right)^{\underline{L}}$. In the third section we are concerned with the Henckell's expansion $\hat{S}^{(2)}$ and as before we give the congruence $\hat{\rho}^{(2)}$, the contraction $h: \rho \rightarrow \hat{\rho}^{(2)}$, the isomorphism $\varphi$ from $\mathrm{X}^{+} / \rho^{(2)}$ onto $\left(\widehat{\mathrm{X}^{+} / \rho}\right)_{A}^{(2)}$ and we end by proving that $\Phi(\mathrm{h})$ is congruent to the expansion $H$ which maps $X^{+} / \rho$ to the cutdown to generators $A$ of the expansion $\left(\widehat{\mathrm{X}^{+} / \rho}\right)^{(2)}$. The fourth section contains some lattice theoretical results about the congruences and the expansions stated in sections 1,2 and 3 . We introduce an expansion $P$, which is shown to be the join of the expansions $\mathrm{E}_{\mathscr{L}}: \mathrm{S} \rightarrow \widetilde{\mathrm{S}}^{\mathscr{L}}$ and $\mathrm{E}_{\mathscr{R}}: \mathrm{S} \rightarrow \widetilde{\mathrm{S}}^{\mathscr{\mathscr { L }}}$. We define the congruence $\rho^{\mathrm{P}}$ corresponding to P , we prove that the contraction $p: \rho \rightarrow \rho \mathrm{p}$ is congruent to the expansion $\mathrm{P}_{\mathrm{A}}$ which maps $S$ to the cutdown to generators $A$ of $P(S)$. The last result of this section is that $\rho \mathrm{P}$ is the meet of $\tilde{\rho}^{\mathscr{L}}$ and $\tilde{\rho}^{\mathscr{P}}$.

In the last chapter we are concerned with the expansions in category of monogenic semigroup $\mathscr{M}$, and the contractions in the congruences on the free monogenic semigroup $F$. In the first section we give a characterization of the congruences on F and the order in ConF. We remark that ConF can be identified
with $\mathscr{A}$. This section is closed by a characterization of contractions in ConF and an example. The second section is devoted to the expansions in the category of monogenic semigroups. We first remark that the set of expansions in $\mathscr{M}, \mathcal{B}_{\mathcal{M}}$, is equal to the set of contractions in $\mathscr{C}_{\mathcal{A}}$. We then give a partial order in $\mathscr{E}_{\mathcal{A}}$, and we define the lattice operations. Finally, we investigate the compatibility conditions of these lattice operations with multiplication.

## CHAPTER 2

## Preliminaries.

The purpose of this chapter is to introduce basic concepts used throughout this thesis and to establish a few properties of these to be used in the succeeding chapters.

### 2.1. Basic concepts concerning semigroups.

Definition 2.1.1. Let $S$ be a set and * be a binary operation on $S$. Then ( $\mathrm{S}, *)$ is called a semigroup if and only if $(a * b) * c=a *(b * c)$ for any $a, b, c \in S$.

It is customary to say $"$ semigroup $S "$ rather than $"$ semigroup ( $\mathrm{S}, *$ ) ".

Definition 2.1.2. A semigroup $S$ is generated by a subset $G$ if every element of $S$ can be written as a product of some elements of $G$, and it is denoted by $S=\langle G\rangle$.

Definition 2.1.3. An equivalence relation $\rho$ on a semigroup $S$ is a left congruence if for all $\mathrm{a}, \mathrm{b}, \mathrm{c} \in \mathrm{S}, \mathrm{a} \rho \mathrm{b}$ implies $\mathrm{ca} \rho \mathrm{cb}$, a right congruence if $\mathrm{a} \rho \mathrm{b}$ implies ac $\rho$ bc; $\rho$ is a congruence if it is both a left and a right congruence.

Lemma 2.1.4. An equivalence relation $\rho$ on a semigroup $S$ is a congruence if and only if for all $\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d} \in \mathrm{S}$ a $\rho \mathrm{b}$ and $\mathrm{c} \rho \mathrm{d}$ implies ac $\rho$ bd.

Proof. Let $\rho$ be a congruence on $S$, let $a, b, c, d \in S$ be such that $a \rho b$ and c $\rho d$. Then since $\rho$ is a right congruence we have ac $\rho$ bc and since $\rho$ is also a left congruence we have bc $\rho$ bd. Hence ac $\rho$ bd. Conversely, if for any $\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d} \in \mathrm{S}, \mathrm{a} \rho \mathrm{b}$ and $\mathrm{c} \rho \mathrm{d}$ implies ac $\rho$ bd then $\rho$ is clearly a congruence . $\bullet$

Definition 2.1.5. For a semigroup $S$ let ConS denote the set of all congruences on $S$.

Let $X$ be a non-empty finite set. A non-empty finite sequence $x_{1}, x_{2}, \ldots, x_{n}$ usually written by juxtaposition, $\mathrm{x}_{1} \mathrm{x}_{2} \ldots \mathrm{x}_{\mathrm{n}}$, of elements of X is called a word over the alphabet X . Let 1 denote the empty word.

Definition 2.1.6. The set $\mathrm{X}^{+}$of all non-empty words with operation of juxtaposition

$$
\left(x_{1} x_{2} \ldots x_{n}\right) \cdot\left(y_{1} y_{2} \ldots y_{n}\right)=x_{1} x_{2} \ldots x_{n} y_{1} y_{2} \ldots y_{n}
$$

is a semigroup called the free semigroup on the set $X$. Let $X^{*}=X^{+} \cup\{1\}$.

For $u=x_{1} x_{2} \ldots x_{n} \in X^{+}$, let |u| denote the length of $u$, which is equal to $n$ in this case.

Definition 2.1.7. For any $i \geq 0$, let $e^{i}$ and $s^{i}$ be functions from $X^{*}$ into $X^{*}$ defined by: Let $u=x_{1} x_{2} \ldots x_{n} \in X^{+}$, then $e^{i}(u)=x_{i+1} x_{i+2} \ldots x_{n}$ and $s^{i}(u)=x_{1} x_{2} \ldots x_{n-i}$.

### 2.2. Basic concepts concerning expansions and $\mathscr{S}_{x \rightarrow}$

Definition 2.2.1. Let $S, T$ be semigroups and $\varphi$ be a function from $S$ into $T$. Then $\varphi$ is called a morphism of semigroup if and only if $(s \varphi) \cdot\left(s^{\prime} \varphi\right)=\left(s \cdot s^{\prime}\right) \varphi$ for any $\mathrm{s}, \mathrm{s}^{\prime} \in \mathrm{S}$.

For a formal definition of a functor, a category and a subcategory the reader is referred to [5] or [8].

Let $\mathscr{P}$ denote the category of all semigroups and morphisms.

Definition 2.2.2. A functor f from a category $\mathscr{A}$ of semigroups into $\mathscr{A}$ is called an expansion if there is a natural transformation $\eta$ from the functor $f$ to the identity functor, such that each $\eta_{s}$ is surjective . This concept was introduced and studied in the papers by Birget and Rhodes [1] and [2] .

Definition 2.2.3. A semigroup $S$ is "generated" by a set $X$ if and only if there exists a function $\alpha: X \rightarrow S$ such that $S=\langle(X) \alpha\rangle$; i.e., $S$ is generated -in the classical sense- by the range $(\mathrm{X}) \alpha$ of $\alpha$; we do not assume that $\mathrm{X} \subseteq \mathrm{S}$, nor even $|\mathrm{X}| \leq|S|$.

Definition 2.2.4. For a given set X , we consider the category $\mathscr{S}_{\mathrm{X}}$ of all semigroups "generated" by X : The objects of the category $\mathscr{S}_{\mathrm{X}}$ are of the form $(S, \alpha)$ where $S$ is a semigroup and $\alpha: X \rightarrow S$ is a function such that $S=\langle(X) \alpha\rangle$.

The morphisms from ( $\mathrm{S}, \alpha$ ) into ( $\mathrm{T}, \beta$ ) are those semigroup morphisms $\varphi: S \rightarrow \mathrm{~T}$ such that the following diagram commutes :

The elements of $\mathscr{S}_{\mathrm{x}}$ are ( $\mathrm{S}, \alpha$ ) but when convenient we will simply write S for (S, $\boldsymbol{\alpha}$ ).

Remark 2.2.5. In $\mathscr{S}_{\mathrm{x}}$, due to the commutativity of the above diagram, any morphism $\varphi$ is necessarily surjective. Moreover, since any morphism is completely determined by its action on a set of generators, the morphisms in $\mathscr{S}_{\mathbf{x}}$ are uniquely determined.

Some other basic properties of $\mathscr{S}_{\mathrm{x}}$ are given in [1].

## CHAPTER 3

In this chapter we develop the concept of contraction and we explicitly give two mappings which are inverse order anti-isomorphisms between the lattice of expansions in $\mathscr{S}_{\mathrm{x}}$ and the lattice of contractions in $\mathrm{ConX}{ }^{+}$.

In the context of $\mathscr{S}_{\mathrm{X}}$, due to the Remark 2.2.5, the definition of an expansion simplifies to the following :

Definition 3.1. Let $\mathscr{A}$ be a subcategory of $\mathscr{S}_{\mathrm{x}}$. A functor $\mathrm{F}: \mathscr{A} \rightarrow \mathscr{A}$ is called an expansion if the following condition is satisfied:
$\mathrm{E}(\mathrm{i})$ For any $(\mathrm{A}, \alpha) \in \mathscr{A}$, there exists an epimorphism $\eta_{\mathrm{A}}: \mathrm{F}(\mathrm{A}) \rightarrow \mathrm{A}$.

Definition 3.2. Let $\mathscr{A}$ be a subcategory of $\mathscr{S}_{\mathrm{x}}$. Let F and G be expansions within $\mathscr{S}_{\mathrm{X}}$ and $\mathscr{A}$, respectively. We say that F is congruent to G if, for any $(\mathrm{S}, \alpha) \in \mathscr{S}_{\mathrm{x}}$, there exist $(\mathrm{T}, \beta) \in \mathscr{A}$ and isomorphisms $\varphi$ and $\psi$ such that $(S, \alpha)$ is isomorphic to $(T, \beta)$ via $\varphi$ and $F(S, \alpha)$ is isomorphic to $G(T, \beta)$ via $\psi$.

Note that, by the remark following Definition 2.2.2, the following diagram is automatically commutative:

For any congruence $\rho \in \operatorname{Con} X^{+}$, let $\imath_{\rho}: X \rightarrow X^{+} / \rho$ be the morphism defined by $(x)_{\rho}=x \rho$.

Let $\mathscr{S}_{\mathrm{X}}{ }^{*}=\left\{\left(\mathrm{X}^{+} / \rho, \mathrm{l}_{\rho}\right): \rho \in \operatorname{Con} \mathrm{X}^{+}\right\}$. Clearly $\mathscr{S}_{\mathrm{X}}{ }^{*}$ is a subcategory of $\mathscr{S}_{\mathrm{X}}$.

Remark 3.3. In $\mathscr{S}_{\mathrm{x}}{ }^{*}$ there exists a homomorphism $\varphi:\left(\mathrm{X}^{+} / \rho, \imath_{\rho}\right) \rightarrow\left(\mathrm{X}^{+} / \tau, \imath_{\tau}\right)$ if and only if $\rho \subseteq \tau$ and when this is the case $\varphi$ is unique.

That being understood, we can identify ( $\mathrm{X}^{+} / \rho, \mathrm{l}$ ) with $\mathrm{X}^{+} / \rho$.

Proposition 3.4. Let F be an expansion in $\mathscr{S}_{\mathrm{X}}$. Then F is congruent to an expansion in $\mathscr{S}_{\mathrm{X}}{ }^{*}$.
Proof. Let F be an expansion in $\mathscr{S}_{\mathrm{X}}$. By the universal property of $\mathrm{X}^{+}$, for any $(\mathrm{S}, \alpha) \in \mathscr{S}_{\mathrm{X}}$, there exists a unique congruence $\rho \in \operatorname{Con} \mathrm{X}^{+}$such that $\left(\mathrm{X}^{+} / \rho, \mathrm{l}_{\rho}\right) \stackrel{\varphi}{=}(\mathrm{S}, \alpha)$, namely $\rho=\alpha \circ \alpha^{-1}$.

Now, define

$$
\begin{aligned}
& \text { G: } \mathscr{S}_{X^{*}} \rightarrow \mathscr{S}_{x^{*}} \text { by } \\
& G: X^{+} / \rho \rightarrow X^{+} / \rho^{F} \quad\left(\rho \in \operatorname{Con} X^{+}\right)
\end{aligned}
$$

where $\rho^{F}$ is the unique congruence on $X^{+}$such that $\left(X^{+} / \rho^{F}, \imath_{\rho} F\right) \cong F\left(X^{+} / \rho, \imath_{\rho}\right)$. For any $\mathrm{X}^{+} / \rho \in \mathscr{S}_{\mathrm{x}^{*}}$, since there exists an epimorphism $\eta$ from $\mathrm{F}\left(\mathrm{X}^{+} / \rho\right)$ onto $X^{+} / \rho$ and an isomorphism $\varphi_{\rho}$ from $G\left(X^{+} / \rho\right)=X^{+} / \rho^{F}$ onto $F\left(X^{+} / \rho\right), \eta^{\prime}=\eta \circ \varphi_{\rho}$ is an epimorphism from $X^{+} / \rho^{F}=G\left(X^{+} / \rho\right)$ onto $X^{+} / \rho$.

$$
\mathrm{G}\left(\mathrm{X}^{+} / \rho\right)=\mathrm{X}^{+} / \rho^{\mathrm{F}} \xrightarrow{\varphi \rho} \mathrm{~F}\left(\mathrm{X}^{+} / \rho\right)
$$

Now, let $\mathrm{X}^{+} / \rho, \mathrm{X}^{+} / \tau \in \mathscr{S}_{\mathrm{X}}{ }^{*}$ and $\theta: \mathrm{X}^{+} / \rho \rightarrow \mathrm{X}^{+} / \tau$ be a morphism. Then there exists an epimorphism $\quad F(\theta): F\left(X^{+} / \rho\right) \rightarrow F\left(X^{+} / \tau\right)$, and isomorphisms

$$
\Phi_{\rho}: \mathrm{X}^{+} / \rho^{\mathrm{F}} \rightarrow \mathrm{~F}\left(\mathrm{X}^{+} / \rho\right) \quad \text { and } \quad \Psi_{\tau}: \mathrm{F}\left(\mathrm{X}^{+} / \tau\right) \rightarrow \mathrm{X}^{+} / \tau^{\mathrm{F}}
$$

Therefore $G(\theta)=\Psi_{\tau} \circ F(\theta) \circ \Phi_{\rho}$ is an epimorphism from $X^{+} / \rho^{F}=G\left(X^{+} / \rho\right)$ onto $\mathrm{X}^{+} / \tau^{\mathrm{F}}=\mathrm{G}\left(\mathrm{X}^{+} / \tau\right)$.

Hence, $G$ is a functor consequently, $G$ is an expansion in $\mathscr{S}_{\mathrm{x}}{ }^{*}$.
Next, let $(\mathrm{S}, \alpha) \in \mathscr{S}_{\mathrm{X}}$. Again by the universal property of $\mathrm{X}^{+}$there exists a unique homomorphism $\varphi: \mathrm{X}^{+} \rightarrow \mathrm{S}$ such that the following diagram commutes:

Since $(S, \alpha) \in \mathscr{S}_{\mathrm{X}}, \varphi$ is an epimorphism and therefore $S \cong \mathrm{X}^{+} / \rho$, where $\rho=\varphi \circ \varphi^{-1}$. By the definition of $G, F(S)$ is isomorphic to $G\left(X^{+} / \rho\right)$. Thus, $F$ is congruent to $G . \bullet$

For the remainder of this chapter, we restrict our attention to $\mathscr{S}_{\mathrm{x}}{ }^{*}$.

Definition 3.5. A function $\mathrm{f}: \mathrm{Con} \mathrm{X}^{+} \rightarrow \mathrm{Con} \mathrm{X}^{+}$is called a contraction if the following conditions are satisfied:
$\mathrm{C}(\mathrm{i}) \mathrm{f}(\rho) \subseteq \rho$ for any $\rho \in \operatorname{Con} X^{+}$.
C(ii) If $\rho, \tau \in \operatorname{Con} X^{+}$and $\rho \subseteq \tau$ then $f(\rho) \subseteq f(\tau)$.

Definition 3.6. Let

$$
\begin{aligned}
& \mathscr{E}=\left\{\mathrm{F}: \mathscr{S}_{\mathrm{x}}^{*} \rightarrow \mathscr{S}_{\mathrm{x}}{ }^{*}, \mathrm{~F} \text { is an expansion }\right\}, \\
& \mathscr{C}=\left\{\mathrm{f}: \operatorname{Con} \mathrm{X}^{+} \rightarrow \operatorname{Con} \mathrm{X}^{+}, \mathrm{f} \text { is a contraction }\right\} .
\end{aligned}
$$

We now introduce order relations on 8 and 8 :
Definition 3.7. For $\mathrm{F}, \mathrm{G} \in \mathscr{\mathcal { E }}$, let $\mathrm{F} \geq \mathrm{G}$ if for any $\mathrm{X}^{+} / \rho \in \mathscr{S}_{\mathrm{x}}{ }^{*}$ there exists an epimorphism $\theta_{\rho}$ from $F\left(X^{+} / \rho\right)$ onto $G\left(X^{+} / \rho\right)$. For $f, g \in \mathscr{C}$, let $f \leq g$ if $\mathrm{f}(\rho) \subseteq \mathrm{g}(\rho)$ for all $\rho \in \operatorname{Con} X^{+}$.

Clearly these are partial orders on $\mathscr{E}$ and $\mathscr{\mathscr { C }}$, respectively.

Lemma 3.8. $\mathscr{C}$ is a latice where

$$
(f \wedge g)(\rho)=f(\rho) \wedge g(\rho) \text { and } \quad(f \vee g)(\rho)=f(\rho) \vee g(\rho)
$$

Proof. Let f and $\mathrm{g} \in \mathscr{C}$ and define $\mathrm{h}: \operatorname{Con} \mathrm{X}^{+} \rightarrow \operatorname{Con} \mathrm{X}^{+}$by:

$$
h(\rho)=f(\rho) \wedge g(\rho) \quad\left(\rho \in \operatorname{Con} X^{+}\right) .
$$

We first show that $h \in \mathscr{E}$.
Since $\mathrm{f}(\rho) \subseteq \rho$ and $\mathrm{g}(\rho) \subseteq \rho$ we have $\mathrm{h}(\rho)=\mathrm{f}(\rho) \wedge \mathrm{g}(\rho) \subseteq \rho$ so that h satisfies $\mathrm{C}(\mathrm{i})$. Let $\tau \subseteq \rho$. Then $\mathrm{f}(\tau) \subseteq \mathrm{f}(\rho)$ and $\mathrm{g}(\tau) \subseteq \mathrm{g}(\rho)$ since $\mathrm{f}, \mathrm{g} \in \mathscr{\mathscr { C }}$ and therefore, we have that $h(\tau)=f(\tau) \wedge g(\tau) \subseteq f(\rho) \wedge g(\rho)=h(\rho)$. Thus $h$ satisfies $\mathrm{C}(\mathrm{ii})$ and $\mathrm{h} \in \mathscr{C}$.

Now, let $t \in \mathscr{C}$ be such that $t \leq f$ and $t \leq g$. Then $t(\rho) \subseteq f(\rho)$ and $t(\rho) \subseteq g(\rho)$ for any $\rho \in \operatorname{Con} X^{+}$. Therefore we have

$$
t(\rho) \subseteq f(\rho) \wedge g(\rho)=h(\rho) \quad \text { for any } \rho \in \operatorname{Con} X^{+}
$$

Thus $t \leq h$. Clearly, $h$ is a lower bound of $f$ and $g$, consequently $h$ is the greatest lower bound of $f$ and $g$.

Next, define $\mathrm{k}: \operatorname{Con} \mathrm{X}^{+} \rightarrow \mathrm{Con} \mathrm{X}^{+}$by

$$
k(\rho)=f(\rho) \vee g(\rho) \quad\left(\rho \in \operatorname{Con} X^{+}\right) .
$$

Let us see that $\mathrm{k} \in \mathscr{C}$ :
Since $f(\rho) \subseteq \rho$ and $g(\rho) \subseteq \rho$ we have $k(\rho)=f(\rho) \vee g(\rho) \subseteq \rho$ and $k$ satisfies $\mathrm{C}(\mathrm{i})$. Let $\tau \subseteq \rho$ then $\mathrm{f}(\tau) \subseteq \mathrm{f}(\rho)$ and $\mathrm{g}(\tau) \subseteq \mathrm{g}(\rho)$ and therefore we have $k(\tau)=f(\tau) \vee g(\tau) \subseteq f(\rho) \vee g(\rho)=k(\rho)$. Thus $k$ satisfies $C(i i)$ and $k \in \mathscr{C}$. Clearly, $k$ is an upper bound of $f$ and $g$.

Now, let $t \in \mathscr{C}$ be such that $t \geq f$ and $t \geq g$. Then $f(\rho) \subseteq t(\rho)$ and $g(\rho) \subseteq t(\rho)$ for any $\rho \in \operatorname{Con} X^{+}$. Therefore we have:

$$
k(\rho)=f(\rho) \vee g(\rho) \subseteq t(\rho) \quad \text { for any } \rho \in \operatorname{Con} X^{+}
$$

Thus $t \geq k$, and $k$ is the least upper bound of $f$ and $g . \bullet$

Definition 3.9. For any $\mathrm{f} \in \mathscr{E}$ let $\mathrm{E}_{\mathrm{f}}: \mathscr{S}_{\mathrm{x}}{ }^{*} \rightarrow \mathscr{S}_{\mathrm{x}}^{*}$ be defined by:

$$
\mathrm{E}_{\mathrm{f}}\left(\mathrm{X}^{+} / \rho\right)=\mathrm{X}^{+} / \mathrm{f}(\rho) \quad\left(\rho \in \operatorname{Con} X^{+}\right)
$$

and similarly for any $\mathrm{F} \in \mathscr{8}$ let $\mathrm{c}_{\mathrm{F}}: \operatorname{Con} \mathrm{X}^{+} \rightarrow \operatorname{Con} \mathrm{X}^{+}$be defined by:

$$
c_{F}(\rho)=\rho^{F} \quad \text { where } \quad F\left(X^{+} / \rho\right)=X^{+} / \rho^{F}
$$

Lemma 3.10. (i) For any $\mathrm{f} \in \mathscr{G}, \mathrm{E}_{\mathrm{f}}$ is an expansion in $\mathscr{S}_{\mathrm{x}}{ }^{*}$.
(ii) For any $\mathrm{F} \in \mathscr{E}, \mathrm{C}_{\mathrm{F}}$ is a contraction.

Proof. (i) Let $\mathrm{X}^{+} / \rho \in \mathscr{S}_{\mathrm{x}}{ }^{*}$. Then $\mathrm{E}_{\mathrm{f}}\left(\mathrm{X}^{+} / \rho\right)=\mathrm{X}^{+} / \mathrm{f}(\rho)$, by the definition of $\mathrm{E}_{\mathrm{f}}$.

Define $\eta$, from $X^{+} / f(\rho)$ into $X^{+} / \rho$, by

$$
(w f(\rho)) \eta=w \rho \quad\left(w \in X^{+}\right)
$$

Then $\eta$ is a well-defined epimorphism since $f(\rho) \subseteq \rho$ and $\rho \in \operatorname{Con} X^{+}$. This proves that $\mathrm{E}_{\mathrm{f}}$ satisfies $\mathrm{E}(\mathrm{i})$.

Now let $\mathrm{X}^{+} / \rho, \mathrm{X}^{+} / \tau \in \mathscr{S}_{\mathrm{x}}{ }^{*}$ and let $\theta: \mathrm{X}^{+} / \rho \rightarrow \mathrm{X}^{+} / \tau$ be a morphism . For this morphism to exist $\rho$ must be contained in $\tau$ and therefore $\theta$ is necessarily surjective. Since $\rho \subseteq \tau$ and $f$ satisfies $C(i i)$, we have $f(\rho) \subseteq f(\tau)$. Next, define $E_{f}(\theta): E_{f}\left(X^{+} / \rho\right) \rightarrow E_{f}\left(X^{+} / \tau\right)$; i.e. , $E_{f}(\theta)$ maps $X^{+} / f(\rho)$ into $X^{+} / f(\tau)$, by

$$
(w f(\rho)) E_{f}(\theta)=w f(\tau) \quad\left(w \in X^{+}\right)
$$

Then $E_{f}(\theta)$ is a well-defined epimorphism since $f(\rho) \subseteq f(\tau)$ and $f(\rho), f(\tau)$ are from Con $\mathrm{X}^{+}$. Thus, $\mathrm{E}_{\mathrm{f}}$ is a functor. Hence, $\mathrm{E}_{\mathrm{f}} \in \mathscr{8}$.
(ii) Let $X^{+} / \rho \in \mathscr{S}_{x}{ }^{*}$. Since $\mathrm{F} \in \mathscr{E}$, there exists an epimorphism $\eta$ from $\mathrm{F}\left(\mathrm{X}_{+}^{+} / \rho\right)=\mathrm{X}^{+} / \rho^{\mathrm{F}}$ onto $\mathrm{X}^{+} / \rho$. Since $\eta$ is a morphism in $\mathscr{S}_{\mathrm{x}^{*}}$, we must have $\rho^{F} \subseteq \rho$. Thus $E_{f}$ satisfies $C(i)$.

Next, let $\rho \subseteq \tau$. The only morphism $\quad \theta: X^{+} / \rho \rightarrow X^{+} / \tau$ is given by $(x \rho) \theta=x \tau$. Then since $F$ is a functor there exists an epimorphism $F(\theta)$ from $\mathrm{F}\left(\mathrm{X}^{+} / \rho\right)$ onto $\mathrm{F}\left(\mathrm{X}^{+} / \tau\right)$; i.e., $\mathrm{F}(\theta)$ maps $\mathrm{X}^{+} / \rho^{\mathrm{F}}$ onto $\mathrm{X}^{+} / \tau^{\mathrm{F}}$. On the other hand $C_{F}(\rho)=\rho^{F}$ and $C_{F}(\tau)=\tau^{F}$. Hence, because we are dealing with morphisms in $\mathscr{S}_{\mathrm{X}}{ }^{*}$, we must have $\mathrm{C}_{\mathrm{F}}(\rho)=\rho^{\mathrm{F}} \subseteq \tau^{\mathrm{F}}=\mathrm{C}_{\mathrm{F}}(\tau)$. This verifies that $\mathrm{c}_{\mathrm{F}}$ satisfies C (ii). Therefore, $\mathrm{c}_{\mathrm{F}} \in \mathscr{C}$.

Definition 3.11. Let $\Phi: \mathscr{C} \rightarrow \mathscr{C}$ and $\Psi: \mathscr{C} \rightarrow \mathscr{C}$ be defined by: $\Phi: f \rightarrow E_{f} \quad(f \in \mathscr{C}) \quad$ and $\quad \Psi: F \rightarrow c_{F} \quad(F \in \mathbb{E})$.

Theorem 3.12. The mappings $\Phi$ and $\Psi$ are inverse order anti-isomorphisms.

Proof. By definition it is clear that for all $\mathrm{f} \in \mathscr{C}, F \in \mathscr{E}$,

$$
\Psi_{o} \Phi(f)=\Psi\left(E_{f}\right)=c_{E_{f}}=f \quad \text { and } \quad \Phi o \Psi(F)=\Phi\left(c_{F}\right)=E_{c_{F}}=F
$$

and so that $\Phi$ and $\Psi$ are inverse bijections.
Now, let $f, g \in \mathscr{C}$ be such that $f \leq g$. Then $f(\rho) \subseteq g(\rho)$ for any $\rho$ in Con $X^{+}$. Therefore, $\theta_{\rho}: X^{+} / f(\rho) \rightarrow X^{+} / g(\rho) \quad$ defined by

$$
(w f(\rho)) \theta_{\rho}=w g(\rho) \quad\left(w \in X^{+}\right)
$$

is an epimorphism. Since $\mathrm{E}_{\mathrm{f}}\left(\mathrm{X}^{+} / \rho\right)=\mathrm{X}^{+} / \mathrm{f}(\rho)$ and $\mathrm{E}_{\mathrm{g}}\left(\mathrm{X}^{+} / \rho\right)=\mathrm{X}^{+} / \mathrm{g}(\rho)$ and since there exists an epimorphism $\theta_{\rho}: \mathrm{E}_{\mathrm{f}}\left(\mathrm{X}^{+} / \rho\right) \rightarrow \mathrm{E}_{\mathrm{g}}\left(\mathrm{X}^{+} / \rho\right)$ for any $\mathrm{X}^{+} / \rho$ in $\mathscr{S}_{\mathrm{x}}^{*}$, we have that $\Phi(\mathrm{f})=\mathrm{E}_{\mathrm{f}} \geq \mathrm{E}_{\mathrm{g}}=\Phi(\mathrm{g})$.

Finally, let $\mathrm{F}, \mathrm{G} \in \mathscr{E}$ with $\mathrm{F} \geq \mathrm{G}$. Then for any $\mathrm{X}^{+} / \rho \in \mathscr{S}_{\mathrm{x}}{ }^{*}$ there exists an epimorphism $\theta_{\rho}$ from $F\left(X^{+} / \rho\right)$ onto $G\left(X^{+} / \rho\right)$; that is

$$
\theta_{\rho}: X^{+} / \rho^{F} \rightarrow X^{+} / \rho^{G}
$$

Then since $\theta_{\rho}$ is a morphism in $\mathscr{S}_{X}{ }^{*}$, we must have that $\rho^{F} \subseteq \rho^{G}$. Hence , $c_{F}(\rho)=\rho^{F} \subseteq \rho^{G}=C_{G}(\rho)$ for any $\rho \in$ Con $X^{+}$, and therefore

$$
\Psi(F)=c_{F} \leq c_{G}=\Psi(G)
$$

as required. Therefore, $\Phi$ and $\Psi$ are inverse order anti-isomorphisms.॰

One important consequence of Lemma 3.8 and Theorem 3.12 is that we can now consider $\mathscr{E}$ as a lattice with respect to the operations

$$
\mathrm{F} \wedge \mathrm{G}=\mathrm{E}\left(\mathrm{C}_{\mathrm{F}} \vee \mathrm{C}_{\mathrm{G}}\right) \quad \text { and } \quad \mathrm{F} \vee \mathrm{G}=\mathrm{E}\left(\mathrm{C}_{\mathrm{F}} \wedge \mathrm{C}_{\mathrm{G}}\right)
$$

Definition 3.13. Let $F, G \in \mathbb{E}$. Define F.G by

$$
\mathrm{F} \cdot \mathrm{G}\left(\mathrm{X}^{+} / \rho\right)=\mathrm{F}\left(\mathrm{G}\left(\mathrm{X}^{+} / \rho\right) \quad\left(\mathrm{X}^{+} / \rho \in \mathscr{S}_{\mathrm{X}}{ }^{*}\right)\right.
$$

Proposition 3.14. $\mathscr{E}$ is a semigroup with the multiplication defined above.

Proof. First let $\mathrm{X}^{+} / \rho \in \mathscr{S}_{\mathrm{x}}{ }^{*}$. By $\mathrm{E}(\mathrm{i})$ there exist epimorphisms $\eta_{\mathrm{G}}$ from $\mathrm{G}\left(\mathrm{X}^{+} / \rho\right)$ onto $\mathrm{X}^{+} / \rho$ and $\eta_{\mathrm{F}}$ from $\mathrm{F}\left(\mathrm{G}\left(\mathrm{X}^{+} / \rho\right)\right.$ ) onto $\mathrm{G}\left(\mathrm{X}^{+} / \rho\right)$. Let $\eta=\eta_{\mathrm{G}} \circ \eta_{\mathrm{F}}$. Then $\eta$ is an epimorphism which maps $\mathrm{F} \cdot \mathrm{G}\left(\mathrm{X}^{+} / \rho\right)=\mathrm{F}\left(\mathrm{G}\left(\mathrm{X}^{+} / \rho\right)\right)$ onto $\mathrm{X}^{+} / \rho$. Next let $\mathrm{X}^{+} / \rho, \mathrm{X}^{+} / \tau \in \mathscr{S}_{\mathrm{X}}{ }^{*}$ and let $\theta: \mathrm{X}^{+} / \rho \rightarrow \mathrm{X}^{+} / \tau$ be a morphism. Then there exist epimorphisms $\theta_{G}$ and $\theta_{\mathrm{F}}$, where

$$
\theta_{\mathrm{G}}: \mathrm{G}\left(\mathrm{X}^{+} / \rho\right) \rightarrow \mathrm{G}\left(\mathrm{X}^{+} / \tau\right) \text { and } \quad \theta_{\mathrm{F}}: \mathrm{F}\left(\mathrm{G}\left(\mathrm{X}^{+} / \rho\right)\right) \rightarrow \mathrm{F}\left(\mathrm{G}\left(\mathrm{X}^{+} / \tau\right)\right) .
$$

Hence F.G is a functor and so, $F \cdot G \in \mathscr{E}$. Since the composition of functions is associative, we have that $\mathrm{F} \cdot(\mathrm{G} \cdot \mathrm{H})=\mathrm{F} \cdot(\mathrm{G} \cdot \mathrm{H})=\mathrm{F} \cdot \mathrm{G} \cdot \mathrm{H}$ for any $\mathrm{F}, \mathrm{G}$ and $\mathrm{H} \in \mathbb{8} . \bullet$

Definition 3.15. Let f and $\mathrm{g} \in \mathscr{C}$. Define $\mathrm{f} \cdot \mathrm{g}$ by

$$
f \cdot g(\rho)=f(g(\rho)) \quad\left(\rho \in \operatorname{Con} X^{+}\right) .
$$

Proposition 3.16. $\mathscr{C}$ is a semigroup with the multiplication defined above. Proof. If $\rho \in \operatorname{Con} X^{+}$then $f \cdot g(\rho)=f(g(\rho)) \subseteq g(\rho) \subseteq \rho$, and if $\rho, \tau \in \operatorname{Con} X^{+}$ with $\rho \subseteq \tau$, then $g(\rho) \subseteq g(\tau)$. Therefore, $f(g(\rho)) \subseteq f(g(\tau))$; that is, $\mathrm{f} \cdot \mathrm{g}(\rho) \subseteq \mathrm{f} \cdot \mathrm{g}(\tau)$. Hence, if $\mathrm{f}, \mathrm{g} \in \mathscr{C}$ then $\mathrm{f} \cdot \mathrm{g} \in \mathscr{G}$. Since the composition of functions is associative, we have that $f \cdot(\mathrm{~g} \cdot \mathrm{~h})=(\mathrm{f} \cdot \mathrm{g}) \cdot \mathrm{h}=\mathrm{f} \cdot \mathrm{g} \cdot \mathrm{h}$, for any $\mathrm{f}, \mathrm{g}$ and h in $\mathscr{E}$. Consequently, $\mathscr{B}$ is a semigroup .•

Let $F, G \in \mathscr{E}$. Since

$$
X^{+} / \rho^{F \cdot G}=F \cdot G\left(X^{+} / \rho\right)=F\left(G\left(X^{+} / \rho\right)\right)=F\left(X^{+} / \rho^{G}\right)=X^{+} /\left(\rho^{G}\right)^{F},
$$

we have that $\rho^{F \cdot G}=\left(\rho^{G}\right)^{F}$. Consequently,

$$
c_{F \cdot G}(\rho)=\rho^{F \cdot G}=\left(\rho^{G}\right)^{F}=c_{F}\left(\rho^{G}\right)=c_{F}\left(c_{G}(\rho)\right) .
$$

That is $\mathrm{C}_{\mathrm{F} \cdot \mathrm{G}}=\mathrm{C}_{\mathrm{F}} \cdot \mathrm{C}_{\mathrm{G}}$. Therefore,

$$
\Psi(\mathrm{F} \cdot \mathrm{G})=\mathrm{c}_{\mathrm{F} \cdot \mathrm{G}}=\mathrm{c}_{\mathrm{F}} \cdot \mathrm{c}_{\mathrm{G}}=\Psi(\mathrm{F}) \cdot \Psi(\mathrm{G})
$$

Theorem 3.17. $\Phi$ and $\Psi$ are semigroup isomorphisims.
Proof. That $\Psi$ is a homomorphism was established prior to the theorem. That $\Phi$ is a semigroup homomorphism follows from the fact that the inverse mapping of a semigroup homomorphism is a semigroup homomorphism .-

Proposition 3.18. For any $F, G \in \mathbb{E}, F \cdot G \geq F \vee G$.
Proof. Let $\mathrm{X}^{+} / \rho \in \mathscr{S}_{\mathrm{x}}{ }^{*}$. Then

$$
\begin{aligned}
(F \vee G)\left(X^{+} / \rho\right) & =E_{\left(c_{F} \wedge c_{G}\right)}\left(X^{+} / \rho\right)=X^{+} /\left(\left(c_{F} \wedge c_{G}\right)(\rho)\right)=X^{+} /\left(c_{F}(\rho) \wedge c_{G}(\rho)\right) \\
& =X^{+} /\left(\rho^{F} \wedge \rho^{G}\right)
\end{aligned}
$$

On the other hand, $F \cdot G\left(X^{+} / \rho\right)=F\left(G\left(X^{+} / \rho\right)\right)=F\left(X^{+} / \rho^{G}\right)=X^{+} /\left(\rho^{G}\right)^{F}$. Also $\left(\rho^{G}\right)^{F} \subseteq \rho^{F}$ by $C$ (ii) since $\rho^{G} \subseteq \rho$, and ( $\left.\rho^{G}\right)^{F} \simeq \rho^{G}$ by $C(i)$. Thus we have that $\left(\rho^{G}\right)^{F} \subseteq \rho^{F} \wedge \rho^{G}$.

Now define $\quad \theta_{\rho}: F \cdot G\left(X^{+} / \rho\right) \rightarrow(F \vee G)\left(X^{+} / \rho\right)$ by

$$
\left(w\left(\rho^{G}\right)^{F}\right) \theta_{\rho}=w\left(\rho^{F} \wedge \rho^{G}\right) \quad\left(w \in X^{+}\right)
$$

Then $\theta_{\rho}$ is an epimorpism, and so $F \cdot G \geq F \vee G . \bullet$

Example 3.19. The inequality in Proposition 3.18. may be strict. Define the Henckell's expansion H , [1] , on a semigroup S by

$$
\mathrm{H}(\mathrm{~S})=\hat{S}^{(2)}=\left\{\left\{\left(\prod_{i}^{m} \mathrm{~s}_{\mathrm{i}}, \prod_{\mathrm{m}+1}^{\mathrm{k}} \mathrm{~s}_{\mathrm{i}}\right) \mid 0 \leq \mathrm{m} \leq \mathrm{k}\right\} \mid\left(\mathrm{s}_{1}, \mathrm{~s}_{2}, \ldots \ldots \ldots, \mathrm{~s}_{\mathrm{k}}\right) \in \mathrm{S}^{+}\right\}
$$

with multiplication

$$
\left\{\left(\prod_{i=1}^{m} s_{i}, \prod_{m+1}^{k} s_{i}\right) \mid 0 \leq m \leq k\right\} \cdot\left\{\left(\prod_{i=k+1}^{r} s_{i}, \prod_{r+1}^{k+n} s_{i}\right) \mid k \leq r \leq k+h\right\}
$$

$$
=\left\{\left.\left(\prod_{i=1}^{n} s_{i}, \frac{\prod_{i n+1}^{k+h}}{\prod_{i}}\right) \right\rvert\, 0 \leq n \leq k+h\right\} .
$$

By [1] we know that $\mathrm{H}(\mathrm{S})$ is a homomorphic image of $\mathrm{H}^{2}(\mathrm{~S})$, but $\mathrm{H}(\mathrm{S})$ is not isomorphic to $\mathrm{H}^{2}(\mathrm{~S})$. So, we have that

$$
(H \vee H)(S)=H(S) \vee H(S)=H(S)
$$

however,

$$
\mathrm{H} \cdot \mathrm{H}(\mathrm{~S})=\mathrm{H}(\mathrm{H}(\mathrm{~S}))=\mathrm{H}^{2}(\mathrm{~S}) .
$$

Thus, $\mathrm{H} \cdot \mathrm{H} \neq \mathrm{H} \vee \mathrm{H}$ in this case.

## CHAPTER 4

In this chapter we construct the contractions corresponding to some known expansions and we give some lattice theoretical results concerning these expansions and contractions.

### 4.1. The contraction corresponding to the machine expansion.

We begin this section with the definition of the left machine expansion. We then introduce a congruence $\bar{\rho}^{\mathscr{\varphi}}$ on $\mathrm{X}^{+}$for any given congruence $\rho$ on $X^{+}$, and a contraction $\mathrm{f}: \rho \rightarrow \bar{\rho}^{\mathscr{L}}$ which is shown to correspond to the left machine expansion.

For $(S, \alpha) \in \mathscr{S}_{\mathrm{x}}$, let

$$
\bar{S}^{\mathscr{L}}=\left\{\left(s_{1} s_{2} s_{3} \ldots s_{n}, s_{2} s_{3} \ldots s_{n}, \ldots, s_{n}\right) \mid s_{1}, s_{2}, \ldots, s_{n} \in S\right\}
$$

with multiplication given by

$$
\begin{aligned}
& \left(s_{1} s_{2} s_{3} \ldots s_{n}, s_{2} s_{3} \ldots s_{n}, \ldots, s_{n}\right) \cdot\left(t_{1} t_{2} t_{3} \ldots t_{m}, t_{2} t_{3} \ldots t_{m}, \ldots, t_{m}\right)= \\
& \left(s_{1} s_{2} \ldots s_{n} t_{1} t_{2} \ldots t_{m}, s_{2} s_{3} \ldots s_{n} t_{1} t_{2} \ldots t_{m}, \ldots, s_{n} t_{1} t_{2} \ldots t_{m}, t_{1} t_{2} t_{3} \ldots t_{m}, t_{2} t_{3} \ldots t_{m}, \ldots, t_{m}\right),
\end{aligned}
$$

and let $\bar{\alpha}^{\mathscr{L}}: \mathrm{x} \rightarrow(\mathrm{x} \alpha)$. Then $\left(\overline{\mathrm{S}}^{\mathscr{L}}, \bar{\alpha}^{\mathscr{L}}\right)$ is called the machine expansion and was introduced by Birget and Rhodes in [1].

Let $A \subseteq S$ such that $S=\langle A\rangle$. Then $\bar{S}_{A}^{\varphi} \subseteq \bar{S}^{\varphi}$ defined by

$$
\overline{\mathrm{S}}_{\mathrm{A}}^{\mathscr{L}}=\langle(\mathrm{a}) \mid \mathrm{a} \in \mathrm{~A}\rangle
$$

is called the cutdown of $\overline{\mathrm{S}}^{\boldsymbol{\varphi}}$ to generators A .

For any $\rho \in \operatorname{Con} \mathrm{X}^{+}$define $\bar{\rho}^{\boldsymbol{\varphi}}$ on $\mathrm{X}^{+}$as follows :
For $u, v \in X^{+}$,
$u \bar{\rho}^{\mathscr{L}} v$ if and only if $e^{i}(u) \rho e^{i}(v)$ for any $i \geq 0$ and $|u|=|v|$.
Since $u \bar{\rho}^{\mathscr{P}} v$ implies, in particular, that $u=e^{0}(u) \rho e^{0}(v)=v$, we have $\bar{\rho}^{\mathscr{s}} \subseteq \rho$.

Lemma 4.1.1. $\bar{\rho}^{\Phi}$ is a congruence on $\mathrm{X}^{+}$.
Proof. Clearly $\bar{\rho}^{\mathscr{L}}$ is an equivalence relation. In order to see that it is a congruence, let $u, v, s$ and $t \in X^{+}$be such that $u \bar{\rho}^{\varphi} v$ and $s \bar{\rho}^{\varphi} t$. It suffices to show that us $\bar{\rho}^{\boldsymbol{q}}$ vt.

Since $|\mathrm{u}|=|\mathrm{v}|$ and $|\mathrm{s}|=|\mathrm{tt}|,|\mathrm{us}|=|\mathrm{u}|+|\mathrm{s}|=|\mathrm{v}|+|\mathrm{t}|=|\mathrm{vt}|$.
Next, let $\mathrm{i} \geq 0$.
If $i \leq|u|=|v|$ then $e^{i}(u s)=e^{i}(u) s$ and $e^{i}(v t)=e^{i}(v) t$. Since $e^{i}(u) \rho e^{i}(v)$ and $s \rho t$ we have $e^{i}(u s)=e^{i}(u) s \rho e^{i}(v) t=e^{i}(v t)$.

If $i>|u|=|v|$ then $e^{i}(u s)=e^{k}(s)$ and $e^{i}(v t)=e^{k}(t) \quad$ where $k=i-|u|=i-|v|$. Since $e^{k}(s) \rho e^{k}(t)$ we have that $e^{i}(u s) \rho e^{i}(v t)$. Hence, us $\bar{\rho}^{\mathscr{\varphi}}$ vt. Consequently, $\bar{\rho}^{-\mathscr{L}}$ is a congruence on $\mathrm{X}^{+}$, as required .•

Let $\rho \in \operatorname{Con} X^{+}$be such that $X^{+} / \rho \cong S$ and let $A=\{x \rho: x \in X\}$. Then $A \subseteq S$ and $S=\langle A\rangle$. We also have that

$$
\overline{\mathrm{S}}_{\mathrm{A}}^{\mathscr{Q}} \cong\left(\overline{\mathrm{X}^{+} / \rho}\right)_{\mathrm{A}}^{\mathscr{Q}}=\langle(\mathrm{x} \mathrm{\rho}) \mid \mathrm{x} \in \mathrm{X}\rangle
$$

$$
=\left\{\left(\left(x_{1} x_{2} \ldots . x_{n}\right) \rho,\left(x_{2} \ldots . x_{n}\right) \rho, \ldots \ldots, x_{n} \rho\right) \mid x_{i} \in X \text { and } n \geq 0\right\}
$$

Now define $\varphi: \mathrm{X}^{+} / \bar{\rho}^{\varphi} \rightarrow\left(\overline{\mathrm{X}^{+} / \rho}\right)_{\mathrm{A}}^{\varphi} \cong \overline{\mathrm{S}}_{\mathrm{A}}^{\varphi}$ by

$$
\varphi:\left(x_{1} x_{2} \ldots x_{n}\right) \bar{\rho}^{\mathscr{\varphi}} \rightarrow\left(\left(x_{1} x_{2} \ldots x_{n}\right) \rho,\left(x_{2} \ldots x_{n}\right) \rho, \ldots, x_{n} \rho\right)
$$

Proposition 4.1.2. $\varphi$ is an isomorphism.
Proof. We first show that $\varphi$ is well-defined.
Let $u, v \in X^{+}$be such that

$$
u=x_{1} x_{2} \ldots x_{n} \quad \bar{\rho}^{\mathscr{\varphi}} \quad y_{1} y_{2} \ldots y_{m}=v .
$$

Then $e^{i}(u) \rho e^{i}(v)$ for any $i \geq 0$ and $n=m$. Therefore we have

$$
\varphi\left(u \bar{\rho}^{\mathscr{L}}\right)=\left(\mathrm{e}^{0}(\mathrm{u}) \rho, \mathrm{e}^{1}(\mathrm{u}) \rho, \ldots \ldots\right)=\left(\mathrm{e}^{0}(\mathrm{v}) \rho, \mathrm{e}^{1}(\mathrm{v}) \rho, \ldots \ldots\right)=\varphi\left(\mathrm{v} \bar{\rho}^{\mathscr{L}}\right) .
$$

Thus, $\varphi$ is well-defined and clearly maps $X^{+} / \bar{\rho}^{\mathscr{\varphi}}$ into $\left(\overline{X^{+} / \rho}\right)_{A}^{\mathscr{A}}$.
We first show that $\varphi$ is injective. Let $u=x_{1} x_{2} \ldots . x_{n}$ and ${ }^{*} v=y_{1} y_{2} \ldots . y_{m}$ be elements of $X^{+}$such that $\quad\left(u \bar{\rho}^{\mathscr{L}}\right) \varphi=\left(v \bar{\rho}^{\mathscr{L}}\right) \varphi$. Then $e^{i}(u) \rho=e^{i}(v) \rho$ for any $i \geq 0$, and $m=n$. That is, $e^{i}(u) \rho e^{i}(v)$ and $|u|=|v|$. It follows from the definition of $\bar{\rho}^{\mathscr{L}}$ that $u \bar{\rho}^{\mathscr{L}} v$. Hence $\varphi$ is one-to-one.

We now show that $\varphi$ is a homomorphism.
Let $u=\left(x_{1} x_{2} \ldots . x_{n}\right)$ and $v=\left(y_{1} y_{2} \ldots \ldots . y_{m}\right) \in X^{+}$. Then

$$
\left(\left(x_{1} x_{2} \ldots . x_{n}\right) \rho^{\mathscr{L}}\right) \varphi=\left(\left(x_{1} x_{2} \ldots . . x_{n}\right) \rho,\left(x_{2} \ldots . x_{n}\right) \rho, \ldots \ldots \ldots . . x_{n} \rho\right)
$$

and

$$
\left(\left(y_{1} y_{2} \ldots . y_{m}\right) \bar{\rho}^{\mathscr{L}}\right) \varphi=\left(\left(y_{1} y_{2} \ldots \ldots y_{m}\right) \rho,\left(y_{2} \ldots . y_{m}\right) \rho, \ldots \ldots \ldots, y_{m} \rho\right)
$$

Therefore,

$$
\left(u \bar{\rho}^{\mathscr{L}}\right) \varphi \cdot\left(v \bar{\rho}^{-\mathscr{L}}\right) \varphi
$$

$$
\begin{aligned}
& =\left(\left(x_{1} x_{2} \ldots x_{n}\right) \rho\left(y_{1} y_{2} \ldots y_{m}\right) \rho, \ldots, x_{n} \rho\left(y_{1} y_{2} \ldots y_{m}\right) \rho,\left(y_{1} y_{2} \ldots y_{m}\right) \rho, \ldots, y_{m} \rho\right) \\
& =\left(\left(x_{1} x_{2} \ldots x_{n} y_{1} y_{2} \ldots y_{m}\right) \rho, \ldots,\left(x_{n} y_{1} y_{2} \ldots y_{m}\right) \rho,\left(y_{1} y_{2} \ldots y_{m}\right) \rho, \ldots, y_{m} \rho\right)
\end{aligned}
$$

and

$$
\begin{aligned}
& \left((u v) \rho^{-\mathscr{L}}\right) \varphi=\left(\left(x_{1} x_{2} \ldots x_{n} y_{1} y_{2} \ldots y_{m}\right) \rho^{-\mathscr{L}}\right) \varphi \\
= & \left(\left(x_{1} x_{2} \ldots x_{n} y_{1} y_{2} \ldots y_{m}\right) \rho, \ldots,\left(x_{n} y_{1} y_{2} \ldots y_{m}\right) \rho,\left(y_{1} y_{2} \ldots y_{m}\right) \rho, \ldots, y_{m} \rho\right) .
\end{aligned}
$$

Therefore,

$$
\left(u \bar{\rho}^{\mathscr{\mathscr { L }}}\right) \varphi \cdot\left(v \bar{\rho}^{\mathscr{\mathscr { L }}}\right) \varphi=\left((\mathrm{uv}) \bar{\rho}^{\mathscr{\mathscr { L }}}\right) \varphi
$$

We finally show that $\varphi$ is surjective. For any $x \in X$, we have that $\mathrm{x} \bar{\rho}^{\mathscr{\varphi}} \in \mathrm{X}^{+} / \bar{\rho}^{\mathscr{\varphi}}$ and $\quad\left(\mathrm{x} \bar{\rho}^{\mathscr{\varphi}}\right) \varphi=(\mathrm{x} \rho)$. Since $\quad\left(\overline{\mathrm{X}^{+} / \rho}\right)_{\mathrm{A}}^{\mathscr{L}}=\langle(\mathrm{x} \rho) \mid \mathrm{x} \in \mathrm{X}\rangle, \varphi$ maps the generators of $X^{+} / \bar{\rho}^{\mathscr{L}}$ onto those of $\left(\overline{X^{+} / \rho}\right)_{A}^{\mathscr{L}}$.

Thus, $\varphi$ is an isomorphism .•

Now define $\mathrm{f}: \operatorname{Con} \mathrm{X}^{+} \rightarrow$ Con $\mathrm{X}^{+} \quad$ by

$$
\mathrm{f}: \rho \rightarrow \bar{\rho}^{\mathscr{L}} \quad\left(\rho \in \operatorname{Con} X^{+}\right)
$$

Lemma 4.1.3. $f \in \mathscr{B}$.
Proof. That $\bar{\rho}^{\mathscr{L}} \subseteq \rho$ was discussed before. For $\rho, \tau \in$ Con $X^{+}$such that $\rho \subseteq \tau$ we clearly have $\bar{\rho}^{\varphi} \subseteq \bar{\tau}^{\varphi} . \bullet$

Now let F be defined by

$$
\mathrm{F}:(\mathrm{S}, \alpha) \rightarrow\left(\overline{\mathrm{S}}_{\mathrm{A}}^{\mathscr{L}}, \bar{\alpha}^{\mathscr{L}}\right) \quad\left((\mathrm{S}, \alpha) \in \mathscr{S}_{\mathrm{X}}\right)
$$

It follows easily from [1] that F is indeed an expansion in $\mathscr{S}_{\mathrm{x}}$.

Theorem 4.1.4. $F$ is congruent to $\mathrm{E}_{\mathrm{f}}$.
Proof. As before, for any $(S, \alpha) \in \mathscr{S}_{\mathrm{X}}$ we know that there exists a unique
congruence $\rho \in \operatorname{Con} X^{+}$such that $(S, \alpha) \cong\left(X^{+} / \rho, \mathfrak{l}_{\rho}\right)$. Then

$$
\begin{aligned}
F(S)=\bar{S}_{A}^{\mathscr{E}} & \cong X^{+} / \rho^{\mathscr{E}} \\
& =X^{+} / f(\rho)=E_{f}\left(X^{+} / \rho\right)
\end{aligned}
$$

so that $F$ is congruent to $\mathrm{E}_{\mathrm{f}} \cdot \bullet$

### 4.2. The contraction corresponding to the expansion $\widetilde{\mathrm{S}}^{\mathscr{Q}}$

In this section we turn our attention to an expansion based on the machine expansion of a semigroup. We introduce a congruence $\tilde{\boldsymbol{p}}^{\mathscr{L}}$ and a contraction $\mathrm{f}: \rho \rightarrow \widetilde{\rho}^{\mathscr{L}}$. We close the section by showing that this contraction corresponds to that expansion.

For $(\mathrm{S}, \alpha) \in \mathscr{S}_{\mathrm{x}}$ let

$$
\widetilde{S}^{S^{\varphi}}=\left\{\left(\prod_{1}^{k} s_{i},\left\{\prod_{m+1}^{k} s_{i} \mid 0 \leq m \leq k\right\}\right) \mid s_{i} \in S\right\}
$$

and

$$
\tilde{\mathrm{S}}^{\Omega}=\left\{\left(\left(\prod_{1}^{\mathrm{n}} \mathrm{~s}_{\mathrm{i}} \mid 0 \leq \mathrm{n} \leq \mathrm{k}\right\}, \prod_{1}^{\mathrm{k}} \mathrm{~s}_{\mathrm{i}}\right) \mid \mathrm{s}_{\mathrm{i}} \in \mathrm{~S}\right\}
$$

Equivalently,

$$
\tilde{S}^{\mathscr{\varphi}}=\left\{\left(s_{1} \ldots s_{\mathrm{n}},\left\{\mathrm{~s}_{1} \mathrm{~s}_{2} \ldots . \mathrm{s}_{\mathrm{n}}, \mathrm{~s}_{2} \ldots \mathrm{~s}_{\mathrm{n}}, \ldots \ldots \ldots, \mathrm{~s}_{\mathrm{n}}, 1\right\}\right) \mid \mathrm{s}_{1}, \ldots, \mathrm{~s}_{\mathrm{n}} \in \mathrm{~S}\right\}
$$

and

$$
\widetilde{S}^{*}=\left\{\left(\left\{s_{1} s_{2} \ldots s_{n}, s_{1} s_{2} \ldots . s_{n-1}, \ldots, s_{1} s_{2}, s_{1}\right\}, s_{1} s_{2} \ldots s_{n}\right) \mid s_{1}, s_{2}, \ldots . s_{n} \in S\right\}
$$

Define a multiplication on $\tilde{\mathrm{S}}^{\mathscr{L}}$ by :

$$
(\mathrm{s}, \mathrm{~A}) \cdot(\mathrm{t}, \mathrm{~B})=(\mathrm{st}, \mathrm{~A} \cdot \mathrm{t} \cup \mathrm{~B})
$$

and on $\widetilde{\mathrm{S}}^{\boldsymbol{e}}$ by:

$$
(A, s) \cdot(B, t)=(A \cup s \cdot B, s t)
$$

where

$$
A \cdot t=\{x t \mid x \in A\} \quad \text { and } \quad s \cdot B=\{s y \mid y \in B\} .
$$

and let $\tilde{\alpha}^{y}: \mathrm{x} \rightarrow(\mathrm{x} \alpha,\{\mathrm{x} \alpha, 1\})$ and $\tilde{\alpha}^{\boldsymbol{s}}: \mathrm{x} \rightarrow(\{1, \mathrm{x} \alpha\}, \mathrm{x} \alpha)$.
The expansions ( $\tilde{\mathrm{S}}^{\mathscr{L}}, \tilde{\alpha}^{\mathscr{L}}$ ) and ( $\tilde{\mathrm{S}}^{\mathscr{E}}, \tilde{\alpha}^{\mathscr{E}}$ ) were introduced in [1] and [3].

Let $A \subseteq S$ such that $S=\langle A\rangle$. Then $\widetilde{\mathrm{S}}_{\mathrm{A}}^{\mathscr{Q}} \subseteq \widetilde{\mathrm{S}}^{\mathscr{L}}$ defined by

$$
\tilde{\mathbb{S}}_{\mathrm{A}}^{\mathscr{Q}}=\langle(\mathrm{a},(\mathrm{a}, 1 \mathrm{l})|\mathrm{a} \in \mathrm{~A}\rangle
$$

is called the cutdown of $\tilde{\mathrm{S}}^{\mathscr{\varphi}}$ to generators A .

For any $\rho \in$ Con $\mathrm{X}^{+}$define $\tilde{\rho}^{\varphi}$ on $\mathrm{X}^{+}$as follows:
For $u, v \in X^{+}$with $|u|=m$ and $|v|=n$,
u $\tilde{\mathcal{P}}^{\mathscr{Q}} \mathrm{v}$ if and only if
(i) $u \rho v$;
(ii) for any $1 \leq \mathrm{k}<\mathrm{m}$, there exists $0 \leq l<\mathrm{n}$ such that $\mathrm{e}^{\mathrm{k}}(\mathrm{u}) \rho \mathrm{e}^{l}(\mathrm{v}) ;$
(iii) for any $1 \leq \mathrm{r}<\mathrm{n}$, there exists $0 \leq \mathrm{s}<\mathrm{m}$ such that $e^{r}(v) \rho e^{s}(u)$.

Lemma 4.2.1. $\widetilde{\rho}^{\mathscr{\varphi}}$ is a congruence on $\mathrm{X}^{+}$.
Proof. Clearly $\tilde{\mathfrak{p}}^{\mathscr{L}}$ is an equivalence relation. We wish to show that $\tilde{p}^{\mathscr{Y}}$ is also a congruence .

Clearly $\tilde{\rho}^{\mathscr{\varphi}} \subseteq \rho$. Let $u, v, w$ and $z \in X^{+}$be such that $u \tilde{\rho}^{\varphi} v$ and $w \tilde{\rho}^{\mathscr{L}} z$ where $|u|=m,|v|=n,|w|=p$ and $|z|=t$. Then $u \rho v$ and $w \rho z$ implies uw $\rho$ vz. Let $1 \leq k<m+p$.

If $1 \leq k<m$ then there exists $0 \leq l \leq n<n+t \quad$ with $\mathrm{e}^{\mathrm{k}}(\mathrm{u}) \rho \mathrm{e}^{l}(\mathrm{v})$. Since $e^{k}(u) w=e^{k}(u w)$ and $e^{l}(v)=e^{l}(v z)$ we have that $e^{k}(u w) \rho e^{l}(v z)$.

If $\mathrm{k}=\mathrm{m}$, let $l=\mathrm{n}$. Then $\mathrm{e}^{\mathrm{k}}(\mathrm{uw})=\mathrm{w} \rho \mathrm{z}=\mathrm{e}^{l}(\mathrm{vz})$ and thus $\mathrm{e}^{\mathrm{k}}(\mathrm{uw}) \rho \mathrm{e}^{l(v z)}$.

If $\mathrm{m}<\mathrm{k}<\mathrm{m}+\mathrm{p}$, let $\mathrm{k}^{\prime}=\mathrm{k}-\mathrm{m}$. Then $1 \leq \mathrm{k}^{\prime}<\mathrm{p}$ and so there exists
 then $0 \leq n \leq l<t+n \quad$ and $\quad e^{\prime}(z)=e^{l}(v z)$.

Hence in all cases, $\mathrm{e}^{\mathrm{k}}(\mathrm{uw}) \rho \mathrm{e}^{l}(\mathrm{vz})$ for some $0 \leq l<\mathrm{t}+\mathrm{n}$.
Similarly for any $1 \leq r<n+t$, there exists $0 \leq s<m+p$ such that $\mathrm{e}^{\mathrm{r}}(\mathrm{vz}) \rho \mathrm{e}^{\mathrm{s}(\mathrm{uw}) \text {. Therefore, } u w \tilde{\rho}^{\mathscr{L}} \mathrm{vz} \text { and so } \tilde{\rho}^{\mathscr{L}} \text { is a congruence . } \bullet ~}$

Let $\rho \in \operatorname{Con} X^{+}$be such that $X^{+} / \rho \cong S$ and $A=\{x \rho: x \in X\}$. Then
$A \subseteq S$ and $S=\langle A\rangle$. Also, we have that

$$
\begin{aligned}
\left.\widetilde{\mathrm{S}}_{\mathrm{A}}^{\mathscr{L}} \cong\left(\widetilde{\mathrm{X}^{+} / \rho}\right)\right)_{\mathrm{A}}^{\mathscr{L}} & =\langle(x \rho,(x \rho, 1\}) \mid x \in X\rangle \\
& \left.=\left\{\left(x_{1} \ldots \mathrm{x}_{\mathrm{n}}\right) \rho,\left(\left(\mathrm{x}_{1} \ldots \mathrm{x}_{\mathrm{n}}\right) \rho, \ldots \ldots,\left(\mathrm{x}_{\mathrm{n}}\right) \rho, 1\right\}\right) \mid \mathrm{x}_{\mathrm{i}} \in \mathrm{X}\right\} .
\end{aligned}
$$

Now, define $\varphi: \mathrm{X}^{+} / \tilde{\rho}^{\varphi} \rightarrow\left(\widetilde{\mathrm{X}^{+} / \rho}\right)_{\mathrm{A}}^{\mathscr{L}} \cong \tilde{\mathrm{S}}_{\mathrm{A}}^{\varphi}$ by :

$$
\left.\varphi:\left(x_{1} \ldots . . x_{n}\right)\right)^{\varphi} \rightarrow\left(\left(x_{1} \ldots, x_{n}\right) \rho,\left\{\left(x_{1} \ldots, x_{n}\right) \rho, \ldots \ldots,\left(x_{n}\right) \rho, 1\right\}\right)
$$

Proposition 4.2.2. $\varphi$ is an isomorphism.
Proof. We first show that $\varphi$ is well-defined. Let $u, v \in X^{+}$such that

$$
\mathrm{u}=\mathrm{x}_{1} \ldots . . \mathrm{x}_{\mathrm{n}} \quad \tilde{\mathrm{\rho}}^{\mathscr{C}} \quad \mathrm{y}_{1} \ldots \mathrm{y}_{\mathrm{m}}=\mathrm{v} .
$$

Then, by the definition of $\tilde{\rho}^{\mathscr{\mathscr { L }}}$, we have that $\left(\mathrm{x}_{1} \ldots \mathrm{x}_{n}\right) \rho=\left(\mathrm{y}_{1} \ldots \mathrm{y}_{\mathrm{m}}\right) \rho$ and for any $\quad 1 \leq i<n$, there exists $0 \leq j<m$ such that $e^{i}(u) \rho=e^{j}(v) \rho$. We also have that for any $1 \leq i^{\prime}<m$, there exists $0 \leq j^{\prime}<n \quad$ such that $e^{i^{\prime}}(v) \rho=e^{\prime}(u) \rho$. Therefore,

$$
\left\{\left(x_{1} \ldots x_{n}\right) \rho, \ldots,\left(x_{n}\right) \rho, 1\right\}=\left\{\left(y_{1} \ldots y_{m}\right) \rho, \ldots,\left(y_{m}\right) \rho, 1\right\}
$$

Hence,

$$
\left.\left((\mathrm{x}) \tilde{\rho}^{\mathscr{L}}\right) \varphi=((\mathrm{y}))^{\mathscr{\varphi}}\right) \varphi .
$$

Thus, $\varphi$ is well-defined.
To see that $\varphi$ is injective, let $u=x_{1} \ldots x_{n}, v=y_{1} \ldots y_{m} \in X^{+}$be such. that $\left((\mathrm{u}) \widetilde{\rho}^{\mathscr{L}}\right) \varphi=\left((\mathrm{v}) \tilde{\rho}^{\mathscr{L}}\right) \varphi$. Then

$$
\left(x_{1} \ldots x_{n}\right) \rho=\left(y_{1} \ldots y_{m}\right) \rho \quad(*)
$$

and

$$
\left\{\left(x_{1} \ldots x_{n}\right) \rho, \ldots,\left(x_{n}\right) \rho, 1\right\}=\left\{\left(y_{1} \ldots y_{m}\right) \rho, \ldots,\left(y_{m}\right) \rho, 1\right\}
$$

Hence, for any $1 \leq i<n$ there exists $0 \leq j<m$ such that $e^{j}(u) \rho e^{j}(v)(* *)$ and conversely, for any $1 \leq \mathrm{i}^{\prime}<\mathrm{m}$, there exists $0 \leq \mathrm{j}^{\prime}<\mathrm{n} \quad$ such that $\mathrm{e}^{\mathrm{i}}(\mathrm{v}) \rho \mathrm{ej}^{\mathrm{j}}(\mathrm{u}) \quad(* * *)$.

Whence, by $(*),(* *)$ and $(* * *)$, u $\tilde{\rho}^{\mathscr{\varphi}} \mathrm{v}$; that is, $(\mathrm{u}) \widetilde{\rho}^{\mathscr{\varphi}}=(\mathrm{v}) \widetilde{\rho}^{\mathscr{\varphi}}$. Thus, $\varphi$ is injective.

To see that $\varphi$ is also a homomorphism let $u=x_{1} \ldots x_{n}, v=y_{1} \ldots y_{m} \in X^{+}$.
Then

$$
\begin{aligned}
& \left.\left((u) \widetilde{\rho}^{\mathscr{L}}\right)\right) \varphi \cdot\left((v) \widetilde{\rho}^{\mathscr{L}}\right) \varphi= \\
= & \left(\left(x_{1} \ldots x_{n}\right) \rho,\left\{\left(x_{1} \ldots x_{n}\right) \rho, \ldots,\left(x_{n}\right) \rho, 1\right\}\right) \cdot\left(\left(y_{1} \ldots y_{m}\right) \rho,\left\{\left(y_{1} \ldots y_{m}\right) \rho, \ldots,\left(y_{m}\right) \rho, 1\right\}\right) \\
= & \left(\left(x_{1} \ldots x_{n} y_{1} \ldots y_{m}\right) \rho,\left\{\left(x_{1} \ldots x_{n} y_{1} \ldots y_{m}\right) \rho, \ldots,\left(x_{n} y_{1} \ldots y_{m}\right) \rho,\left(y_{1} \ldots y_{m}\right) \rho, \ldots,\left(y_{m}\right) \rho, 1\right\}\right) \\
= & \left(\left(x_{1} \ldots x_{n} y_{1} \ldots y_{m}\right) \tilde{\rho}^{\mathscr{L}}\right) \varphi=\left((u v) \widetilde{\rho}^{\mathscr{L}}\right) \varphi
\end{aligned}
$$

Finally, we show that $\varphi$ is surjective. Let $x \in X$ and
$\left.(x \rho,(x \rho, 1\}) \in \widetilde{\mathrm{X}^{+} / \rho}\right)_{\mathrm{A}}^{\mathscr{L}}$. Then $\mathrm{x} \tilde{\rho}^{\varphi} \in \mathrm{X}^{+} / \tilde{\chi}^{\varphi}$ and $\left(\mathrm{x} \tilde{\rho}^{\varphi}\right) \varphi=(\mathrm{x} \rho,\{\mathrm{x} \rho, 1\})$. Since $\left(\widetilde{\mathrm{X}^{\dagger} / \rho}\right)_{\mathrm{A}}^{\mathscr{L}}$ is generated by $\{(\mathrm{x} \rho,\{x \rho, 1\}) \mid \mathrm{x} \in \mathrm{X}\}$ and $\varphi$ is onto on generators, $\varphi$ is surjective .-

$$
\begin{aligned}
\text { Now define } & l: \operatorname{Con} \mathrm{X}^{+} \rightarrow \operatorname{Con} \mathrm{X}^{+} \quad \text { by: } \\
& l: \rho \rightarrow \mathfrak{p}^{\Phi} .
\end{aligned}
$$

Lemma 4.2.3. $l \in \mathscr{E}$.
Proof. That $\tilde{\rho}^{\mathscr{L}} \subseteq \rho$ is clear from the definition of $\tilde{\rho}^{\mathscr{L}}$, part (i). For $\rho, \tau \in \operatorname{Con} X^{+}$such that $\rho \subseteq \tau$, we clearly have $\tilde{\rho}^{\mathscr{\varphi}} \subseteq \tilde{\tau}^{\boldsymbol{\varphi}} \cdot$

Now let L be defined by

$$
L:(\mathrm{S}, \alpha) \rightarrow\left(\widetilde{\mathrm{S}}_{\mathrm{A}}^{\mathscr{Y}}, \widetilde{\alpha}^{\mathscr{Y}}\right) \quad(\mathrm{S}, \alpha) \in \mathscr{S}_{\mathrm{x}} .
$$

It follows from [1] or [7] that L is indeed an expansion in $\mathscr{S}_{\mathrm{x}}$.

Proposition 4.2.4. L is congruent to $\mathrm{E}_{l}$.
Proof. As before, for any $(\mathrm{S}, \alpha) \in \mathscr{S}_{\mathrm{x}}$, we know that there exists a unique $\rho \in \operatorname{Con} X^{+}$such that $X^{+} / \rho \cong S$. Then, by Proposition 4.2.2,

$$
\mathrm{L}(\mathrm{~S})=\widetilde{\mathrm{S}}_{\mathrm{A}}^{\varphi} \cong \mathrm{X}^{+} / \mathrm{p}^{\varphi}=\mathrm{X}^{+} / l(\rho)=\mathrm{E}_{l}\left(\mathrm{X}^{+} / \rho\right)
$$

so that L is congruent to $\mathrm{E}_{l} \cdot \bullet$
4.3. The contraction corresponding to the Henckell's expansion.

This section is devoted to Henckell's expansion. We first recall this
expansion and then introduce a congruence $\hat{\rho}^{(2)}$ for any given $\rho \in \operatorname{Con} X^{+}$. This is followed by the definition of a contraction $h: \rho \rightarrow \hat{\rho}^{(2)}$. We then show that this contraction corresponds to the Henckell's expansion.

For $(S, \alpha) \in \mathscr{S}_{\mathrm{X}}$ let

$$
\hat{S}^{(2)}=\left\{\left\{\left(\prod_{1}^{m} s_{i}, \prod_{m+1}^{k} s_{i}\right): 0 \leq m \leq k\right\} \mid s_{1}, \ldots, s_{k} \in S\right\}
$$

with multiplication

$$
\begin{aligned}
& \left\{\left(\prod_{1}^{\mathrm{m}} \mathrm{~s}_{\mathrm{i}}, \prod_{\mathrm{m}+1}^{\mathrm{k}} \mathrm{~s}_{\mathrm{i}}\right): 0 \leq \mathrm{m} \leq \mathrm{k}\right\} \cdot\left\{\left(\prod_{\mathrm{k}+1}^{l} \mathrm{~s}_{\mathrm{i}}, \prod_{l+1}^{\mathrm{n}+\mathrm{k}} \mathrm{~s}_{\mathrm{i}}\right): \mathrm{k} \leq l \leq \mathrm{n}+\mathrm{k}\right\} \\
& \quad=\left\{\left(\prod_{1}^{\mathrm{r}} \mathrm{sin}_{\mathrm{i}}^{\mathrm{n}}, \prod_{\mathrm{r}+1}^{\mathrm{n}} \mathrm{~s}_{\mathrm{i}}\right): 0 \leq \mathrm{r} \leq \mathrm{n}+\mathrm{k}\right\}
\end{aligned}
$$

and let $\hat{\alpha}: x \rightarrow\{(x \alpha, 1),(1, x \alpha)\}$.
Then $\left(\hat{\mathrm{S}}^{(2)}, \hat{\alpha}\right)$ is called the Henckell's expansion and was introduced in [1].

Let $A \subseteq S$ such that $S=\langle A\rangle$. Then $\hat{S}_{A}^{(2)} \subseteq \hat{S}^{(2)}$ defined by

$$
\hat{S}_{A}^{(2)}=\langle\{(1, a),(a, 1)\} \mid a \in A\rangle
$$

is called the cutdown of $\hat{\mathrm{S}}^{(2)}$ to generators A .

For $\rho \in \operatorname{Con} X^{+}$define $\hat{\rho}^{(2)}$ on $X^{+}$as follows :
For $u, v \in X^{+}$, where $|u|=m$ and $|v|=n$,
$u \hat{\rho}^{(2)} v \quad$ if and only if
(i) for any $0 \leq \mathrm{i}<\mathrm{m}$, there exists $0 \leq \mathrm{j}<\mathrm{n}$ such that $\mathrm{s}^{\mathrm{i}}(\mathrm{u}) \rho \mathrm{s}^{\mathrm{j}}(\mathrm{v})$ and $\mathrm{e}^{\mathrm{m}-\mathrm{i}}(\mathrm{u}) \rho \mathrm{e}^{\mathrm{n}-\mathrm{j}}(\mathrm{v}) ;$
(ii) for any $0 \leq \mathrm{k} \leq \mathrm{n}$ there exists $0 \leq l \leq \mathrm{n}$ such that $s^{k}(v) \rho s^{l}(u)$ and $e^{n-k}(v) \rho e^{m-l}(u)$.

Lemma 4.3.1. $\hat{\rho}^{(2)}$ is a congruence on $\mathrm{X}^{+}$.
Proof. Clearly $\hat{\rho}^{(2)}$ is an equivalence relation. To see that it is also a congruence we first show that $\hat{\rho}^{(2)} \subseteq \rho$. Let $u, v \in X^{+}$be such that $u \hat{\rho}^{(2)} v$. Then $s^{0}(u) \rho s^{j}(v)$ for some $0 \leq j<n$ and $e^{m}(u) \rho e^{m-j}(v)$. Therefore, $u=s^{0}(u) e^{m}(u) \rho s^{j}(v) e^{m-j}(v)=v$. Hence, $u \rho v$, as required.

Now let $u, v, w$ and $z \in X^{+}$be such that $u \hat{\rho}^{(2)} v$ and $w \hat{\rho}^{(2)} z$, where $|u|=m,|v|=n,|w|=p$ and $|z|=r . \quad$ Then $|u w|=m+p$ and $|v z|=n+r$.

Next, let $0 \leq \mathrm{i}<\mathrm{m}+\mathrm{p}$.
Case (i) $0 \leq i<p$. Since $w \hat{\rho}^{(2)} z$ there exists $0 \leq j<r$ such that $s^{i}(w) \rho s^{j}(z)$ and $e^{p-i}(w) \rho e^{r-j}(z)$. Since $u \hat{\rho}^{(2)} v$ and therefore $u \rho v$, by the above, we have that $u s^{i}(w) \rho \operatorname{vsi}(z)$. But since $0 \leq i<p=|w|$ and $0 \leq \mathrm{j}<\mathrm{r}=|\mathrm{z}|$, we have $\mathrm{us} \mathrm{s}^{\mathrm{i}}(\mathrm{w})=\mathrm{s}^{\mathrm{i}}(\mathrm{uw})$ and $\mathrm{vs}^{\mathrm{i}}(\mathrm{z})=\mathrm{si}(\mathrm{vz})$. Hence, $s^{i}(u v) \rho s^{j}(v z)$. Also,since $0 \leq i<p=|w|$ and $0 \leq j<r=|z|$, we have that $e^{p-i}(w)=e^{m+p-i}(u w)$ and $e^{r-j}(z)=e^{n+r-j}(v z)$. Thus, $e^{(m+p)-i}(u w) \rho e^{(n+r)-j(v z)}$.

Case (ii) $i=p$. Let $j=r$. Then e have $s^{i}(u w)=u \rho v=s j(v z)$ and $e^{(m+p)-i}(u w)=e^{m+p-p}(u w)=e^{m}(u w)=w \rho \quad z=e^{n}(v z)=e^{n+r-r}(v z)=e^{(n+r)-j}(v z)$.

Case (iii) $\mathrm{p}<\mathrm{i}<\mathrm{p}+\mathrm{m}$. Then $0<\mathrm{i}-\mathrm{p}<\mathrm{m}$ and so there exists $0 \leq \mathrm{j}<\mathrm{n}$
 and $s^{\prime}(v)=s^{j}(v z)$. Since $s^{i-p}(u)=s^{i}(u w)$, we have that $s^{i}(u w) \rho s^{j}(v z)$. Also, since $w \rho z, e^{m+p-i}(u) w=e^{(m+p)-i}(u w)$ and $e^{n-j}(v) z=e^{n-(j-r)}(v z)=e^{(n+r)-j(v z)}$, we have that $e^{(m+p)-i}(u w) \rho e^{(n+r)-j(v z)}$.

In cases (i),(ii) and (iii) we have shown that uw and $\mathbf{v z}$ satisfy condition (i) in the definition of $\hat{\rho}^{(2)}$. That they also satisfy condition (ii) is similarly shown. Hence, uw $\hat{\rho}^{(2)}$ vz and therefore, $\hat{\rho}^{(2)}$ is a congruence .•

Let $\rho \in \operatorname{Con} X^{+}$be such that $X^{+} / \rho \cong S$ and $A=\{x \rho \mid x \in X\}$. Then $A \subseteq S$ and $S=\langle A\rangle$. Also, we have that

$$
\begin{aligned}
\left.\hat{S}_{A}^{(2)} \cong \widehat{\left(X^{+} / \rho\right.}\right)_{A}^{(2)} & =\langle\{(1, x \rho),(x \rho, 1)\} \mid x \in X\rangle \\
& =\left\{\left\{\left(\left(\prod_{1}^{m} x_{i}\right) \rho,\left(\prod_{m+1}^{n} x_{i}\right) \rho\right) \mid 0 \leq m \leq n\right\} \mid n \geq 1 \text { and } x_{i} \in X\right\} .
\end{aligned}
$$

Now define $\varphi: X^{+} / \hat{\rho}^{(2)} \rightarrow\left(\widehat{\left.X^{+} / \rho\right)_{A}^{(2)}} \cong \hat{S}_{A}^{(2)}\right.$ by

$$
\varphi:\left(x_{1}, \ldots, x_{n}\right) \hat{\rho}^{(2)} \rightarrow\left\{\left(\left(\prod_{1}^{\mathrm{m}} x_{i}\right) \rho,\left(\prod_{m+1}^{n} x_{i}\right) \rho\right) \mid 0 \leq m \leq n\right\}
$$

Proposition 4.3.2. $\varphi$ is an isomorphism.
Proof. We first show that $\varphi$ is well defined.
Let $u, v \in X^{+}$be such that $u=x_{1} \ldots . . x_{n} \hat{\rho}^{(2)} y_{1} \ldots . . y_{k}=v$. Let $1 \leq m \leq n$ and $\mathrm{i}=\mathrm{n}-\mathrm{m}$. Then $0 \leq \mathrm{i}<\mathrm{n}$ and hence there exists $0 \leq \mathrm{j}<\mathrm{k}$ such that

$$
\prod_{1}^{m} x_{r}=s^{i}\left(x_{1} \ldots . x_{n}\right) \quad \rho \quad s j\left(y_{1} \ldots . y_{k}\right)=\prod_{1}^{\mathrm{k}-\mathrm{j}} y_{r}
$$

and

$$
\prod_{m+1}^{n} x_{r}=e^{n-i}\left(x_{1} \ldots . . x_{n}\right) \quad \rho \quad e^{k-j}\left(y_{1} \ldots . y_{k}\right)=\prod_{k-j+1}^{k} y_{r}
$$

For $m=0$, since $u \rho v,(1, u \rho)=(1, v \rho)$.
Hence, for any $0 \leq m \leq n$ there exist $0 \leq k-j \leq k$ such that :

$$
\left(\left(\prod_{1}^{m} x_{r}\right) \rho,\left(\prod_{m+1}^{n} r_{i}\right) \rho\right)=\left(\left(\prod_{1}^{k-j} y_{r}\right) \rho,\left(\prod_{k-j+1}^{k} y_{r}\right) \rho\right)
$$

Similarly any pair

$$
\left(\left(\prod_{1}^{l} y_{\mathrm{i}}\right) \rho,\left(\prod_{l+1}^{\mathrm{k}} \mathrm{y}_{\mathrm{i}}\right) \rho\right)
$$

is equal to a pair of the form

$$
\left(\left(\prod_{1}^{p_{l}} x_{i}\right) p,\left(\prod_{p_{l}+1}^{n} x_{i}\right) p\right) .
$$

Hence, $u \varphi=v \varphi$. Consequently, $\varphi$ is well-defined.
To see that $\varphi$ is injective, let $u=x_{1} \ldots . . x_{n}, v=y_{1} \ldots . . y_{m} \in X^{+}$be such that

$$
\left((u) \hat{\rho}^{(2)}\right) \varphi=\left((v) \hat{\rho}^{(2)}\right) \varphi
$$

Then for any $0 \leq r<n$ there exists $0 \leq t<m$ such that $\left(\prod_{1}^{\mathrm{r}} \mathrm{x}_{\mathrm{i}}\right) \rho=\left(\prod_{1}^{\mathrm{t}} \mathrm{y}_{\mathrm{i}}\right) \rho \quad$ and $\quad\left(\prod_{\mathrm{r}+1}^{\mathrm{n}} \mathrm{x}_{\mathrm{i}}\right) \rho=\left(\prod_{\mathrm{i}+1}^{\mathrm{m}} \mathrm{x}_{\mathrm{i}}\right) \rho$; i. e., $\left(\prod_{1}^{\mathrm{I}} \mathrm{x}_{\mathrm{i}}\right) \rho\left(\prod_{1}^{\mathrm{t}} \mathrm{y}_{\mathrm{i}}\right)$ and $\left(\prod_{\mathrm{r}+1}^{\mathrm{n}} \mathrm{x}_{\mathrm{i}}\right) \rho\left(\prod_{\mathrm{t}+1}^{\mathrm{m}} \mathrm{y}_{\mathrm{i}}\right)$.

That is, for any $0 \leq \mathrm{k}<\mathrm{n}$, if we let $\mathrm{r}=\mathrm{n}-\mathrm{k}$ then there exists $0 \leq \mathrm{t}<\mathrm{m}$ such that

$$
s^{\mathrm{k}}(\mathrm{u})=\prod_{1}^{\mathrm{I}} \mathrm{x}_{\mathrm{i}} \quad \rho \quad \prod_{1}^{\mathrm{t}} \mathrm{y}_{\mathrm{i}}=\mathrm{s}^{\mathrm{m}-\mathrm{t}}(\mathrm{v})
$$

and

$$
e^{n-k}(u)=\prod_{r+1}^{n} x_{i} \quad \rho \quad \prod_{\mathrm{t}+1}^{m} y_{i}=e^{t-j}(v)
$$

Similarly, for any $0 \leq p<m$, there exists $0 \leq l<n$ such that

$$
s^{p}(\mathrm{v}) \rho \mathrm{s}^{l}(\mathrm{u}) \cdot \text { and } \mathrm{e}^{\mathrm{m}-\mathrm{p}}(\mathrm{v}) \rho \mathrm{s}^{\mathrm{n}-1}(\mathrm{u}) .
$$

Thus, $\quad u \hat{\rho}^{(2)} v$ and so, $\varphi$ is injective.
To see that $\varphi$ is a homomorphism, let $u=x_{1} \ldots x_{n}, v=x_{n+1} \ldots x_{n+k} \in X^{+}$. Then we have that:

$$
\begin{aligned}
\left((u) \hat{\rho}^{(2)}\right) \varphi \cdot\left((v) \hat{\rho}^{(2)}\right) \varphi & =\{\left(\prod_{1}^{m} x_{i}\right) \rho,(\overbrace{m+1}^{n+k} x_{i}) \rho) \mid 0 \leq m \leq n+k\} \\
& =\left(\left(x^{\prime}\right) \hat{\rho}^{(2)}\right) \varphi .
\end{aligned}
$$

Finally, we show that $\varphi$ is surjective. Let $\mathbf{x} \in \mathbf{X}$ and

$$
\left.\{(x \rho, 1),(1, x \rho)\} \in \widehat{\left(X^{+} / \rho\right.}\right)_{A}^{(2)} .
$$

Then

$$
\begin{aligned}
& \text { (x) } \hat{\rho}^{(2)} \in X^{+} / \hat{\rho}^{(2)} \text { and } \\
& \quad\left[(x) \hat{\rho}^{(2)}\right] \varphi=\{(1, x \rho),(x \rho, 1)\} .
\end{aligned}
$$

Since $\left(\widehat{X^{+} / \rho}\right)_{A}^{(2)}$ is generated by $\{\{(1, x \rho),(x \rho, 1)\} \mid x \in X\}, \varphi$ is surjective . $\bullet$

$$
\begin{aligned}
\text { Now define } & h: \operatorname{Con} \mathrm{X}^{+} \rightarrow \operatorname{Con} \mathrm{X}^{+} \text {by } \\
& \mathrm{h}: \rho \rightarrow \hat{\rho}^{(2)} .
\end{aligned}
$$

Lemma 4.3.3. $\mathrm{h} \in \mathscr{C}$.
Proof. That $\hat{\rho}^{(2)} \subseteq \rho$ was discussed in the proof of Lemma 4.3.1. For $\rho, \tau \in \operatorname{Con} X^{+}$such that $\rho \subseteq \tau$ we clearly have $\hat{\rho}^{(2)} \subseteq \hat{\tau}^{(2)} \cdot \bullet$

Now let H be defined by

$$
H:(S, \alpha) \rightarrow\left(\hat{S}_{A}^{(2)}, Q\right) \quad(S, \alpha) \in \mathscr{S}_{X} .
$$

It follows easily from [1] that H is indeed an expansion.

Proposition 4.3.4. H is congruent to $\mathrm{E}_{\mathrm{h}}$.
Proof. As before, for any $(\mathrm{S}, \alpha) \in \mathscr{S}_{\mathrm{x}}$, we know that there exists a unique $\rho \in \operatorname{Con} X^{+}$such that $X^{+} / \rho \cong S$. Then

$$
\begin{aligned}
H(S)=S_{A}^{(2)} & \cong X^{+} / \rho^{(2)} \quad \text { (by Proposition 4.3.2) } \\
& =X^{+} / h(\rho)=E_{h}\left(X^{+} / \rho\right),
\end{aligned}
$$

so that H is congruent to $\mathrm{E}_{\mathrm{h}} \cdot \bullet$

### 4.4. Some lattice theoretical results.

In this section we introduce the congruence $\boldsymbol{\beta}^{\boldsymbol{\varepsilon}}$ which is the dual of $\boldsymbol{p}^{\boldsymbol{\varepsilon}}$ and we show, by an example, that $\hat{\rho}^{(2)} \supsetneqq \tilde{\rho}^{\mathscr{L}} \wedge \tilde{p}^{\boldsymbol{e}}$. We then turn our attention to expansions; in particular to $\widetilde{\mathrm{S}}^{\mathscr{y}}$ and $\widetilde{\mathrm{S}}^{\boldsymbol{e}}$. We define an expansion $P: S \rightarrow P(S)$ and we prove that $P(S)=\tilde{S}^{\varphi} \vee \tilde{S}^{\ell}$. We then introduce the contraction $\mathrm{p}: \rho \rightarrow \rho^{\mathrm{P}}$ corresponding to the expansion $\mathrm{P}: \mathrm{S} \rightarrow \mathrm{P}(\mathrm{S})$. We conclude this section by showing that $\rho^{\mathrm{P}}=\tilde{\rho}^{\Psi} \vee \tilde{\rho}^{\ell}$.

Definition 4.4.1. Let $\rho \in \operatorname{Con} X^{+}$. Define $\tilde{\rho}^{\boldsymbol{\ell}}$ on $\mathrm{X}^{+}$as follows:
For $\mathrm{u}, \mathrm{v} \in \mathrm{X}^{+}$, where $|\mathrm{u}|=\mathrm{m}$ and $|\mathrm{v}|=\mathrm{n}$,
$u p^{2} v \quad$ if and only if
(i) $u \rho v$;
(ii) For any $1 \leq \mathrm{k}<\mathrm{m}$ there exists $0 \leq l<\mathrm{n}$ such that $\mathrm{s}^{\mathrm{k}}(\mathrm{u}) \rho \mathrm{s}^{l}(\mathrm{v})$; and
(iii) For any $1 \leq \mathrm{r}<\mathrm{n}$ there exists $0 \leq s<\mathrm{m}$ such that $\mathrm{s}^{\mathrm{r}}(\mathrm{v}) \rho \mathrm{s}^{s}(\mathrm{u})$.

## Proposition 4.4.2.

(i) $\tilde{\rho}^{x}$ is a congruence on $\mathrm{X}^{+}$.
(ii) Let $r: \operatorname{Con} \mathrm{X}^{+} \rightarrow \operatorname{Con} \mathrm{X}^{+}$be defined by

$$
r: \rho \rightarrow \tilde{p}^{2} \quad\left(\rho \in \operatorname{Con} X^{+}\right) .
$$

Then $r \in \mathscr{C}$.
(iii) Let $\mathrm{R}:(\mathrm{S}, \alpha) \rightarrow\left(\tilde{\mathrm{S}}_{\mathrm{A}}^{\Omega}, \tilde{\alpha}^{\boldsymbol{\alpha}}\right) \quad(\mathrm{S}, \alpha) \in \mathscr{S}_{\mathrm{x}}$ (it follows from [1] or
[7] that R is indeed an expansion in $\mathscr{S}_{\mathrm{X}}$ ). Then $\mathrm{E}_{\mathrm{r}}$ is congruent to R .

Proof. All statements are the duals of results in 4.2 and may be proved similarly. $\bullet$

Clearly $\quad \hat{\rho}^{(2)} \leq \tilde{\rho}^{\mathscr{L}}$ and $\hat{\rho}^{(2)} \leq \tilde{\rho}^{\mathscr{S}}$. Thus, $\hat{\rho}^{(2)} \leq\left(\tilde{\rho}^{\mathscr{L}} \wedge \tilde{\rho}^{\mathscr{C}}\right)$.

We now prove, by an example, that $\hat{\rho}^{(2)} \lessgtr\left(\tilde{\rho}^{\mathscr{L}} \wedge \tilde{\rho}^{\mathscr{q}}\right)$.

Example 4.4.3. Let $X=\left\{x_{1}, x_{2}, x_{3}, x_{4}, x_{5}\right\}$. Define $\rho$ on $X^{+}$by
$u \rho v$ if and only if $|u|=|v|=1$ or $|u|$ and $|v|>1 \quad\left(u, v \in X^{+}\right)$
Clearly $\rho$ is a congruence on $X^{+}$and $X^{+} / \rho \cong S=\{0,1\}$ where the multiplication on $S$ is defined by $1 \cdot 1=0 \cdot 1=1 \cdot 0=0 \cdot 0=0$.

Let $u=x_{1} x_{2} x_{3} x_{4}$ and $v=x_{1} x_{2}$, then $|u|=4$ and $|v|=2$. We now will show that $(u, v) \in \tilde{\rho}^{\mathscr{L}},(u, v) \in \tilde{\rho}^{\boldsymbol{a}}$ but $(u, v) \notin \hat{\rho}^{(2)}$.

To see that $u \tilde{\rho}^{\mathscr{L}} v$, first note that $u \rho v$. Next let $1 \leq k<4$. If $\mathrm{k} \leq 2$ then with $l=0$ we have $\mathrm{e}^{\mathrm{k}}(\mathrm{u}) \rho \mathrm{e}^{l}(\mathrm{v})$, while if $\mathrm{k}=2$ then with $l=1$ we have $\mathrm{e}^{\mathrm{k}}(\mathrm{u}) \rho \mathrm{e}^{l}(\mathrm{v})$. Conversely, since $|\mathrm{v}|=2$ and $1 \leq \mathrm{r} \leq|\mathrm{v}|, \mathrm{r}$ must be 1 , in which case taking $s=3$ we have $\mathrm{e}^{\mathrm{r}}(\mathrm{v}) \rho \mathrm{e}^{S(u)}$. Hence, $(u, v) \in \tilde{\rho}^{\mathscr{S}}$.

Dually, $(u, v) \in \tilde{\rho}^{x}$.
However, for $i=1, s^{i}(u)=x_{1} x_{2} x_{3}$ and $\left|s^{i}(u)\right|=3>1$. Therefore, $s^{i}(u) \rho s j(v)$ only if $|s j(v)|>1$. But $2=|v| \geq s j(v)$ for any $j \geq 0$ and so $s^{i}(u) \rho s_{j}(v)$ only if $j=0$; that is, $s_{j}(v)=s^{0}(v)=v$. But then we have

$$
e^{m-i}(u)=e^{4-1}(u)=x_{4} \quad \text { and } \quad e^{n-j}(v)=e^{2-0}(v)=e^{2}(v)=\varnothing
$$

so that $\left(e^{m-i}(u), e^{n-j}(v)\right) \notin \rho$. Thus, $u$ and $v$ do not satisfy the condition
(i) in the definition of $\hat{\rho}^{(2)}$, and as a result $(u, v) \notin \hat{\rho}^{(2)}$. It follows that $\hat{\rho}^{(2)} \varsubsetneqq \tilde{\rho}^{\mathscr{Q}} \wedge \tilde{\rho}^{\mathscr{Q}}$.

We now turn our attention to expansions .
For $(\mathrm{S}, \alpha) \in \mathscr{S}_{\mathrm{X}}$, let

$$
P(S)=\left\{\left(\left\{\prod_{1}^{n} s_{i} \mid 0 \leq n \leq k\right\}, \prod_{1}^{k} s_{i},\left(\prod_{m+1}^{k} s_{i} \mid 0 \leq m \leq k\right\}\right) s_{i} \in S\right\} .
$$

Define the multiplication on $\mathrm{P}(\mathbf{S})$ by

$$
\left(A_{1}, s, A_{2}\right) \cdot\left(B_{1}, t, B_{2}\right)=\left(A_{1} \cup s \cdot B_{1}, s t, A_{2} \cdot t \cup B_{2}\right)
$$

where $s \cdot B_{1}=\left\{s x \mid x \in B_{1}\right\}$ and $A_{2} \cdot t=\left\{y t \mid y \in A_{2}\right\}$
and let $p(\alpha): x \rightarrow(\{1, x \alpha\}, x \alpha,(x \alpha, 1\})$.
It is easily seen that $P(S)$ is a semigroup.

Lemma 4.4.4. Define $\mathrm{P}: \mathscr{S}_{\mathrm{x}} \rightarrow \mathscr{S}_{\mathrm{x}}$ by $\mathrm{P}:(\mathrm{S}, \alpha) \rightarrow(\mathrm{P}(\mathrm{S}), \mathrm{p}(\alpha))$. Then P is an expansion in $\mathscr{S}_{\mathrm{x}}$.
Proof. Let $(S, \alpha) \in \mathscr{S}_{x}$. Define $\eta: P(S) \rightarrow S$ as follows:

$$
\eta:\left(\left\{\prod_{1}^{n} s_{i} \mid 0 \leq n \leq k\right\}, \prod_{1}^{k} s_{i},\left\{\prod_{m+1}^{k} s_{i} \mid 0 \leq m \leq k\right\}\right) \rightarrow \prod_{1}^{k} s_{i}
$$

Clearly $\eta$ is an epimorphism. Next, let $\mathrm{S}, \mathrm{T} \in \mathscr{S}_{\mathrm{x}}$ and $\theta: \mathrm{S} \rightarrow \mathrm{T}$ an epimorphism. Define $P(\theta): P(S) \rightarrow P(T)$ by

$$
\begin{aligned}
P(\theta): & \left.\left(\left\{\prod_{1}^{n} s_{i} \mid 0 \leq n \leq k\right\}, \prod_{1}^{k} s_{i}, \prod_{m+1}^{k} s_{i} \mid 0 \leq m \leq k\right\}\right) \rightarrow \\
& \left.\left(\left\{\prod_{1}^{n} s_{i}\right) \theta \mid 0 \leq n \leq k\right\},\left(\prod_{1}^{k} s_{i}\right) \theta,\left\{\left(\prod_{m+1}^{k} s_{i}\right) \theta \mid 0 \leq m \leq k\right\}\right) .
\end{aligned}
$$

Then $P(\theta)$ is an epimorphism, thus $P$ is a functor. Hence $P$ is an expansion in $\mathscr{S}_{\mathrm{x}} \cdot \bullet$

Let $\mathrm{E}_{\mathscr{L}}, \mathrm{E}_{\mathscr{R}} \in \mathscr{\mathscr { E }}$ be defined by $\mathrm{E} \mathscr{\mathscr { L }}: \mathrm{S} \rightarrow \widetilde{\mathrm{S}}^{\mathscr{\varphi}}$ and $\mathrm{E} \mathscr{\mathscr { R }}: \mathrm{S} \rightarrow \tilde{\mathrm{S}}^{\mathscr{M}} \quad\left(\mathrm{S} \in \mathscr{S}_{\mathrm{X}}\right)$.

For expansions $\mathrm{E}, \mathrm{F}$ in $\mathscr{S}_{\mathrm{x}}$, let $\mathrm{E} \leq \mathrm{F}$ if and only if there exists an epimorphism $\quad \theta(S): F(S) \rightarrow E(S)$ for any $(S, \alpha) \in \mathscr{S}_{x}$. The relation $\leq$ is not a partial order. However, although we are aware of this, for the next part of the discussion we will proceed in the understanding that we are only working within isomorphism of expansions.

Proposition 4.4.5. $\mathrm{P}=\mathrm{E}_{\mathscr{L}} \vee \mathrm{E}_{\mathscr{R}}$.
Proof. For any $S \in \mathscr{S}_{\mathrm{x}}{ }^{*}$, clearly

$$
\theta_{\mathscr{L}}: \mathrm{P}(\mathrm{~S}) \rightarrow \tilde{\mathrm{S}}^{\mathscr{L}} \text { and } \theta_{\mathscr{R}}: \mathrm{P}(\mathrm{~S}) \rightarrow \tilde{\mathrm{S}}^{\mathscr{I}}
$$

defined by:

$$
\begin{aligned}
\theta \mathscr{L}:\left(\left\{\prod_{1}^{\mathrm{n}} \mathrm{~s}_{\mathrm{i}} \mid 0 \leq \mathrm{n} \leq \mathrm{k}\right\}, \prod_{1}^{\mathrm{k}} \mathrm{~s}_{\mathrm{i}},\left\{\prod_{\mathrm{m}+1}^{\mathrm{k}} \mathrm{~s}_{\mathrm{i}} \mid 0 \leq \mathrm{m} \leq \mathrm{k}\right\}\right) & \rightarrow \\
& \left.\left(\prod_{1}^{\mathrm{k}} \mathrm{~s}_{\mathrm{i}}, \prod_{\mathrm{m}+1}^{\mathrm{k}} \mathrm{~s}_{\mathrm{i}} \mid 0 \leq \mathrm{m} \leq \mathrm{k}\right\}\right)
\end{aligned}
$$

and

$$
\begin{aligned}
& \theta_{\mathscr{K}}:\left(\left\{\prod_{1}^{\mathrm{n}} \mathrm{~s}_{\mathrm{i}} \mid 0 \leq \mathrm{n} \leq \mathrm{k}\right\}, \prod_{1}^{\mathrm{k}} \mathrm{~s}_{\mathrm{i}},\left\{\prod_{\mathrm{m}+1}^{\mathrm{k}} \mathrm{~s}_{\mathrm{i}} \mid 0 \leq \mathrm{m} \leq \mathrm{k}\right\}\right) \rightarrow \\
&\left(\left\{\prod_{1}^{\mathrm{n}} \mathrm{~s}_{\mathrm{i}} \mid 0 \leq \mathrm{n} \leq \mathrm{k}\right\}, \prod_{1}^{\mathrm{k}} \mathrm{~s}_{\mathbf{i}}\right)
\end{aligned}
$$

are epimorphisms. Hence $\mathrm{P} \geq \mathrm{E}_{\mathscr{L}}$ and $\mathrm{P} \geq \mathrm{E}_{\mathscr{R}}$.
To see that $\mathrm{P}=\mathrm{E}_{\mathscr{L}} \vee \mathrm{E}_{\mathscr{R}}$, let $\mathrm{F} \in \mathscr{E}$ be such that $\mathrm{F} \geq \mathrm{E}_{\mathscr{L}}$ and $\mathrm{F} \geq$ $\mathrm{E}_{\mathscr{R}}$. Let $\mathrm{S} \in \mathscr{S}_{\mathrm{x}}{ }^{*}$. Then there exist epimorphisms $\varphi_{\mathscr{L}}: \mathrm{F}(\mathrm{S}) \rightarrow \widetilde{\mathrm{S}}^{\mathscr{S}}$ and $\varphi_{\mathscr{X}}: \mathrm{F}(\mathrm{S}) \rightarrow \widetilde{\mathrm{S}}^{\mathscr{E}}$, such that the following diagram commutes:

Now, let

$$
\mathrm{I}=\left\{\left(\mathrm{s} \varphi_{\mathscr{R}}, \mathrm{s} \varphi_{\mathscr{L}}\right) \mid \mathrm{s} \in \mathrm{~F}(\mathrm{~S})\right\} .
$$

Since the above diagram is commutative we have $(\mathrm{s}) \varphi_{\mathscr{L}} \circ \eta_{\mathscr{L}}=(\mathrm{s}) \varphi_{\mathscr{A}} \circ \eta_{\mathscr{A}}$. Hence the pairs ( $s \varphi_{\mathscr{A}}, s \varphi_{\mathscr{L}}$ ) are of the form :

$$
\left(\left(\left\{\prod_{1}^{n} s_{i} \mid 0 \leq n \leq k\right\}, \prod_{1}^{k} s_{i}\right),\left(\prod_{1}^{k} s_{i},\left\{\prod_{m+1}^{k} s_{i} \mid 0 \leq m \leq k\right\}\right)\right)
$$

(Recall that $\eta_{\mathscr{L}}$ and $\eta_{\mathscr{A}}$ are the projection mappings on the first and second coordinates, respectively). We define the multiplication on I by :

$$
\left(\left(\mathrm{A}_{1}, \mathrm{~s}\right),\left(\mathrm{s}, \mathrm{~A}_{2}\right)\right) \cdot\left(\left(\mathrm{B}_{1}, \mathrm{t}\right),\left(\mathrm{t}, \mathrm{~B}_{2}\right)\right)=\left(\left(\mathrm{A}_{1} \cup \mathrm{~s} \cdot \mathrm{~B}_{1}, \mathrm{st}\right),\left(\mathrm{st}, \mathrm{~A}_{2} \cdot \mathrm{t} \cup \mathrm{~B}_{2}\right)\right)
$$

where $s \cdot B_{1}=\left\{s x \mid x \in B_{1}\right\}$ and $A_{2} \cdot t=\left\{y t \mid y \in A_{2}\right\}$.
Let $\quad \Psi: F(S) \rightarrow I$ be defined by

$$
\Psi: s \rightarrow\left(s \varphi_{\mathscr{A}}, s \varphi_{\mathscr{L}}\right) .
$$

Since $\left(s \varphi_{\mathscr{A}}, s \varphi_{\mathscr{L}}\right) \cdot\left(\mathrm{t} \varphi_{\mathscr{A}}, \mathrm{t} \varphi_{\mathscr{L}}\right)=\left(\mathrm{s} \varphi_{\mathscr{A}}+\mathrm{t} \varphi_{\mathscr{R}}, s \varphi_{\mathscr{L}} \cdot \mathrm{t} \varphi_{\mathscr{L}}\right)$

$$
=\left((\mathrm{st}) \varphi_{\mathscr{R}},(\mathrm{st}) \varphi_{\mathscr{L}}\right) .
$$

and $\varphi_{\mathscr{A}}$ and $\varphi_{\mathscr{L}}$ are epimorphisms, $\Psi$ is an epimorphism.
Next, define $\chi: I \rightarrow P(S)$ by

$$
\begin{array}{r}
\chi:\left(\left(\left\{\prod_{1}^{n} s_{i} \mid 0 \leq n \leq k\right\}, \prod_{1}^{k} s_{i}\right),\left(\prod_{1}^{k} s_{i},\left\{\prod_{m+1}^{k} s_{i} \mid 0 \leq m \leq k\right\}\right)\right) \rightarrow \\
\left(\left\{\prod_{1}^{n} s_{i} \mid 0 \leq n \leq k\right\}, \prod_{1}^{k} s_{i},\left\{\prod_{m+1}^{k} s_{i} \mid 0 \leq m \leq k\right\}\right) .
\end{array}
$$

It is not difficult to verify that $\chi$ is an isomorphism. Let $\theta=\chi \circ \Psi$, then we have that $\theta: F(S) \rightarrow P(S)$ is an epimorphism. Thus, $F \geq P$ and this proves that $\mathrm{P}=\mathrm{E}_{\mathscr{L}} \vee \mathrm{E}_{\mathscr{R}} \cdot \bullet$

For $\rho \in \operatorname{Con} \mathrm{X}^{+}$, define $\rho^{\mathrm{P}}$ on $\mathrm{X}^{+}$as follows :

For $u, v \in X^{+}$, where $|u|=m$ and $|v|=n$,
$\mathrm{u} \rho^{\mathrm{P}} \mathrm{v} \quad$ if and only if
(i) $u \rho \mathrm{v}$;
(ii) for any $1 \leq \mathrm{i}<\mathrm{m}$ there exist $0 \leq \mathrm{j}, \mathrm{j}^{\prime}<\mathrm{n}$ such that $s^{i}(u) \rho s^{j}(v)$ and $e^{i}(u) \rho e^{j}(v) ;$
(iii) for any $1 \leq \mathrm{k}<\mathrm{n}$ there exist $0 \leq l, l^{\prime}<\mathrm{m}$ such that $s^{k}(v) \rho s^{l}(u)$ and $e^{k}(v) \rho e^{l^{\prime}}(u)$.

Lemma 4.4.6. $\rho^{P} \in \operatorname{Con} X^{+}$.
Proof. Clearly $\rho^{P}$ is an equivalence relation. To see that it is also a congruence, let $u, v, w$ and $z \in X^{+}$be such that $u \rho^{P} v$ and $w \rho^{P} z$, where $|u|=m,|v|=n$, $|w|=p$ and $|z|=t$.

Let $1 \leq \mathrm{i}<\mathrm{m}+\mathrm{p}$.
If $1 \leq i<m$ then there exists $0 \leq j^{\prime}<n \leq n+t$ such that $e^{i}(u) \rho e^{\prime}(v)$. Since $e^{i}(u) w=e^{i}(u w)$ and $e^{j^{\prime}}(v) z=e^{j^{\prime}}(v z)$, we have $e^{i}(u w) \rho e^{j^{\prime}}(v z)$.

If $\mathrm{m}<\mathrm{i}<\mathrm{m}+\mathrm{p}$ then setting $\mathrm{i}^{\prime}=\mathrm{i}-\mathrm{m}$, we have that $1 \leq \mathrm{i}^{\prime}<\mathrm{p}$ and so there exists $0 \leq j<t$ such that $e^{i^{\prime}(w)} \rho e^{j}(z)$. Let $j^{\prime}=j+n$. Then $0 \leq j^{\prime}<n+t$. We also have $e^{j}(z)=e^{j^{\prime}}(v z)$ and $e^{i^{\prime}}(w)=e^{i}(u w)$, whence $e^{i}(u w) \rho e^{i^{\prime}}(v z)$.

If $i=m$ then setting $j^{\prime}=n$ we have that $e^{i(u w)}=w \quad \rho \quad z=e^{j}(v z)$. Hence, in all cases, there exists $0 \leq j^{\prime}<n+t$ such that $e^{i}(u w) \rho \mathrm{ej}^{\prime}(v z)$. We now look at the following cases :

If $1 \leq i<p$ then there exists $0 \leq j<t$ such that $s^{i}(w) \rho s i(z)$. Since $s^{i}(u w)=u s^{i}(w)$ and $s^{j}(v z)=v s^{j}(z)$ and $u \rho v$ we have $s^{i}(u w) \rho s i(v z)$.

If $p<i \leq m+p$ then setting $i^{\prime}=i-p$, we have that $1 \leq i^{\prime}<m$ and so there exists $0 \leq k<n$ such that $s^{i^{\prime}}(\mathrm{u}) \rho \mathrm{s}^{\mathrm{k}}(\mathrm{v})$. Let $\mathrm{j}=\mathrm{k}+\mathrm{t}$. Then we have
$s^{k}(v)=s j(v z)$ and $s^{i^{\prime}}(u)=s^{i}(u w)$. Thus $s^{i}(u w) \rho s i(v z)$.
If $i=p$ then setting $j=t$ we have that $s^{i}(u w)=u \quad \rho \quad v=s j(v z)$.
Thus in all cases there also exists $0 \leq j<n+t \quad$ such that $s^{i}(u w) \rho s_{j}(v z)$.
Dually for any $1 \leq \mathrm{k}<\mathrm{n}+\mathrm{t}$ there exist $0 \leq l, l^{\prime}<\mathrm{m}+\mathrm{p} \quad$ such that $e^{k}(v z) \quad \rho \quad e^{l^{\prime}(u w)}$ and $s^{k}(v z) \quad \rho \quad s^{l}(u w)$. Therefore, uv $\rho^{P} v z$. Hence $\rho^{P}$ is a congruence . $\bullet$

Let $A \subseteq S$ such that $S=\langle A\rangle$. Then $P(S)_{A} \subseteq P(S)$ defined by

$$
P(S)_{A}=\langle(\{1, a\}, a,\{a, 1\}) \mid a \in A\rangle
$$

is called the cutdown of $\mathrm{P}(\mathrm{S})$ to generators A .

Let $\rho \in$ Con $X^{+}$be such that $X^{+} / \rho \cong S$. Let $A=\{x \rho \mid x \in X\}$. Then $A \subseteq S, S=\langle A\rangle$ and we have $P(S)_{A} \cong P\left(X^{+} / \rho\right)_{A} \quad$ where

$$
\begin{aligned}
& P\left(X^{+} / \rho\right)_{A}=\langle(\{1, x \rho\}, \dot{x} \rho,\{x \rho, 1\}) \mid x \in X\rangle \\
& \quad=\left\{\left(\left\{1,\left(x_{1}\right) \rho, \ldots,\left(x_{1} \ldots x_{n}\right) \rho\right\},\left(x_{1} \ldots x_{n}\right) \rho,\left\{\left(x_{1} \ldots x_{n}\right) \rho, \ldots .,\left(x_{n}\right) \rho, 1\right\}\right) \mid x_{i} \in X\right\}
\end{aligned}
$$

Define $\varphi: X^{+} / \rho^{P} \rightarrow P\left(X^{+} / \rho\right)_{A} \cong P(S)_{A} \quad$ by:
$\varphi:\left(x_{1} \ldots x_{n}\right) \rho^{P} \rightarrow\left(\left\{1,\left(x_{1}\right) \rho, \ldots,\left(x_{1} \ldots x_{n}\right) \rho\right\},\left(x_{1} \ldots x_{n}\right) \rho,\left\{\left(x_{1} \ldots x_{n}\right) \rho, \ldots,\left(x_{n}\right) \rho, 1\right\}\right)$.

Proposition 4.4.7. $\varphi$ is an isomorphism.
Proof. We first show that $\varphi$ is well defined. Let $u=x_{1} \ldots x_{n} \rho^{P} y_{1} \ldots y_{m}=v$. Then from the definition of $\rho^{P}$ we have :

$$
\begin{aligned}
& \left\{1,\left(x_{1}\right) \rho, \ldots,\left(x_{1} \ldots x_{n}\right) \rho\right\}=\left\{1,\left(y_{1}\right) \rho, \ldots,\left(y_{1} \ldots y_{m}\right) \rho\right\} \\
& \left\{\left(x_{1} \ldots x_{n}\right) \rho, \ldots,\left(x_{n}\right) \rho, 1\right\}=\left\{\left(y_{1} \ldots y_{m}\right) \rho, \ldots,\left(y_{m}\right) \rho, 1\right\}
\end{aligned}
$$

and

$$
\left(x_{1} \ldots x_{n}\right) \rho=\left(y_{1} \ldots y_{m}\right) \rho .
$$

Thus, $\left((\mathrm{u}) \rho^{\mathrm{P}}\right) \varphi=\left((\mathrm{v}) \rho^{\mathrm{P}}\right) \varphi$ and $\varphi$ is well defined.
To see that $\varphi$ is injective, let $u=x_{1} \ldots x_{n}, \quad v=y_{1} \ldots y_{m} \in X^{+}$be such that $\left((\mathrm{u}) \rho^{\mathrm{P}}\right) \varphi=\left((\mathrm{v}) \rho^{\mathrm{P}}\right) \varphi$. Then

$$
\begin{aligned}
& \left(x_{1} \ldots x_{n}\right) \rho=\left(y_{1} \ldots y_{m}\right) \rho ; \\
& \left\{1,\left(x_{1}\right) \rho, \ldots,\left(x_{1} \ldots x_{n}\right) \rho\right\}=\left\{1,\left(y_{1}\right) \rho, \ldots\left(y_{1} \ldots y_{m}\right) \rho\right\} ;
\end{aligned}
$$

and

$$
\left\{\left(x_{1} \ldots x_{n}\right) \rho, \ldots,\left(x_{n}\right) \rho\right\}=\left\{\left(y_{1} \ldots y_{m}\right) \rho, \ldots,\left(y_{m}\right) \rho, 1\right\}
$$

Hence $u \rho^{P} v$, i.e., $(u) \rho^{P}=(v) \rho^{P}$ and $\varphi$ is injective.
To see that $\varphi$ is also a homomorphism let $u=x_{1} \ldots x_{n}, v=y_{1} \ldots y_{m} \in X^{+}$. Then

$$
\begin{aligned}
&\left((u) \rho^{P}\right) \varphi \cdot\left((v) \rho^{P}\right) \varphi \\
&=\left(\left\{1,\left(x_{1}\right) \rho, \ldots,\left(x_{1} \ldots x_{n}\right) \rho\right\},\left(x_{1} \ldots x_{n}\right) \rho,\left(\left(x_{1} \ldots x_{n}\right) \rho, \ldots,\left(x_{n}\right) \rho\right\}\right) \\
& \quad\left(\left\{1,\left(y_{1}\right) \rho, \ldots\left(y_{1} \ldots y_{m}\right) \rho\right\},\left(y_{1} \ldots y_{m}\right) \rho,\left\{\left(y_{1} \ldots y_{m}\right) \rho, \ldots,\left(y_{m}\right) \rho, 1\right\}\right) \\
&=\left(\left\{1,\left(x_{1}\right) \rho, \ldots,\left(x_{1} \ldots x_{n}\right) \rho,\left(x_{1} \ldots x_{n} y_{1}\right) \rho, \ldots,\left(x_{1} \ldots x_{n} y_{1} \ldots y_{m}\right) \rho\right\},\left(x_{1} \ldots x_{n} y_{1} \ldots y_{m}\right) \rho,\right. \\
&\left.\left.\left\{x_{1} \ldots x_{n} y_{1} \ldots y_{m}\right) \rho, \ldots,\left(x_{n} y_{1} \ldots y_{m}\right) \rho,\left(y_{1} \ldots y_{m}\right) \rho, \ldots\left(y_{m}\right) \rho, 1\right\}\right) \\
&=\left(\left(x_{1} \ldots x_{n} y_{1} \ldots y_{m}\right) \rho P\right) \varphi .
\end{aligned}
$$

Finally we show that $\varphi$ is surjective. Let $\mathrm{x} \in \mathrm{X}$, and $(\{1, x \rho\}, x \rho,\{x \rho, 1\})$ be an element of $P\left(X^{+} / \rho\right)_{A}$. Then $x \rho^{P} \in X^{+} / \rho^{P}$ and $\left(x \rho^{P}\right) \varphi=(\{1, x \rho\}, x \rho,\{x \rho, 1\})$. Since $P\left(X^{+} / \rho\right)_{A}$ is generated by

$$
\{(\{1, x \rho\}, x \rho,(x \rho, 1\}) \mid x \in X\}
$$

and $\varphi$ is onto on generators, $\varphi$ is surjective . $\bullet$

Now define $p: \operatorname{Con} \mathrm{X}^{+} \rightarrow \mathrm{Con}^{+}$by

$$
p: \rho \rightarrow \rho^{\mathrm{P}} .
$$

Lemma 4.4.8. $p \in \mathscr{C}$.
Proof. That $p(\rho)=\rho^{P} \subseteq \rho$ is clear from the definition of $\rho^{P}$. For $\rho, \tau \in \operatorname{Con} X^{+}$ such that $\rho \subseteq \tau$ we clearly have $p(\rho)=\rho^{\mathrm{P}} \subseteq \tau^{\mathrm{P}}=p(\tau) . \bullet$

Now, let $\mathrm{P}_{\mathrm{A}}$ be defined by

$$
\mathrm{P}_{\mathrm{A}}:(\mathrm{S}, \alpha) \rightarrow\left(\mathrm{P}(\mathrm{~S})_{\mathrm{A}}, \mathrm{p}(\alpha)\right) \quad(\mathrm{S}, \alpha) \in \mathscr{S}_{\mathrm{X}}
$$

It is easy to verify that $\mathrm{P}_{\mathrm{A}}$ is an expansion in $\mathscr{S}_{\mathbf{x}}$.

Proposition 4.4.9. $\mathrm{P}_{\mathrm{A}}$ is congruent to $\mathrm{E}_{p}$.
Proof. As before, for any ( $\mathrm{S}, \alpha \cdot) \in \mathscr{S}_{\mathrm{x}}$ we know that there exists a unique congruence $\rho \in \operatorname{Con} X^{+}$such that $(S, \alpha) \cong\left(X^{+} / \rho, \imath_{\rho}\right)$. Then

$$
\begin{aligned}
\mathrm{P}_{\mathrm{A}}(\mathrm{~S})=\mathrm{P}(\mathrm{~S})_{\mathrm{A}} & \cong \mathrm{X}^{+} / p(\rho) \\
& =\mathrm{E}_{p}\left(\mathrm{X}^{+} / \rho\right)
\end{aligned}
$$

so that $\mathrm{P}_{\mathrm{A}}$ is congruent to $\mathrm{E}_{p} . \bullet$

Proposition 4.4.10. $\rho^{\mathrm{P}}=\tilde{\rho}^{\mathscr{L}} \wedge \tilde{\rho}^{\boldsymbol{\ell}}$.
Proof. Let $L, R$ be defined, as before, by

$$
\mathrm{L}: \mathrm{S} \rightarrow \tilde{\mathrm{~S}}_{\mathrm{A}}^{\mathscr{Q}} \quad \text { and } \quad \mathrm{R}: \mathrm{S} \rightarrow \tilde{\mathrm{~S}}_{\mathrm{A}}^{\mathscr{Q}}
$$

Then, by 4.4.5, $\mathrm{P}_{\mathrm{A}}=\mathrm{L} \vee \mathrm{R}$. Let $\rho \in \operatorname{Con} \mathrm{X}^{+}$. Then ,by 4.4.9,

$$
\begin{aligned}
\rho^{P}=p(\rho) & =c_{p_{A}}(\rho)=\left(\Psi\left(\mathrm{P}_{\mathrm{A}}\right)\right)(\rho)=(\Psi(\mathrm{L} \vee \mathrm{R}))(\rho) \\
& =(\Psi(\mathrm{L}) \wedge \Psi(\mathrm{R}))(\rho) \\
& =(\Psi(\mathrm{L})(\rho) \wedge(\Psi(\mathrm{R}))(\rho) \\
& =\tilde{\rho}^{\mathscr{}} \wedge \tilde{\rho}^{\mathscr{l}} .
\end{aligned}
$$

## CHAPTER 5

In this chapter we turn our attentions to the category of monogenic semigroups. First we are going to characterize the contractions in $\operatorname{Con} \mathrm{X}^{+}$, where $X=\{x\}$. Then we look at the expansions in the category of monogenic semigroups and we give some results concerning the lattice of the expansions in this category.

### 5.1. The contractions in the congruences on the free monogenic semigroup.

We start this section with a characterization of the congruences on the free monogenic semigroup, F. These results are well-known, although not perhaps in this form, and follow easily from the description of monogenic semigroups to be found in Howie [6] and Clifford and Preston [4]. Then, we give the order on ConF. Finally, we define the contractions in ConF and we present an example.

Let $X=\{x\}$. The free semigroup $F$ on $X$ is $F=\left\{x^{m}: m=1,2, \ldots\right\}$ with the
 index i and period p .

Let $\mathscr{M}=\{[\mathrm{i}, \mathrm{p}] \mid \mathrm{i}, \mathrm{p}$ are integers, $\mathrm{i} \geq 0, \mathrm{p} \geq 1\}$.

Definition 5.1.1. For any $[\mathrm{i}, \mathrm{p}] \in \mathscr{A}$, define $\rho_{[i, p]}$ on F by $\mathrm{x}^{\mathrm{m}} \rho_{[\mathrm{i}, \mathrm{p}]} \mathrm{x}^{\mathrm{n}}$ if and only if $\mathrm{m}=\mathrm{n}<\mathrm{i}+1$ or $\mathrm{m}, \mathrm{n} \geq \mathrm{i}+1$ and $\mathrm{p} \mid \mathrm{m}-\mathrm{n}$.

Lemma 5.1.2. $P_{[i, \mathrm{p}]}$ is a congruence on F .

Proof. That $\rho_{[i, p]}$ is an equivalence relation is clear. To see that it is a congruence, let $m, n, r$ and $s \in\{1,2,3, \ldots\}$ be such that $x^{m} \rho_{[i, p]} x^{n}$ and $x^{r} \rho_{[i, p]} x^{s}$. We want to show that $x^{m} \cdot x^{r}=x^{m+r} \rho_{[i, p]} x^{n+s}=x^{n} \cdot x^{s}$.

If $\mathrm{m}=\mathrm{n}<\mathrm{i}+1$ and $\mathrm{r}=\mathrm{s}<\mathrm{i}+1$ then $\mathrm{m}+\mathrm{r}=\mathrm{n}+\mathrm{s}$ and either $\mathrm{m}+\mathrm{r}=\mathrm{n}+\mathrm{s}<\mathrm{i}+1$, in which case we have $\mathrm{x}^{\mathrm{m}+\mathrm{r}} \rho_{[\mathrm{i}, \mathrm{p}]} \mathrm{x}^{\mathrm{n}+\mathrm{s}}$, or $\mathrm{m}+\mathrm{r}=\mathrm{n}+\mathrm{s} \geq \mathrm{i}+1$, and if this is the case we have $\mathrm{p} \mid(\mathrm{m}+\mathrm{r})-(\mathrm{n}+\mathrm{s})=0$ hence, $\mathrm{x}^{\mathrm{m}+\mathrm{r}} \rho_{[i, \mathrm{p}]} \mathrm{x}^{\mathrm{n}+\mathrm{s}}$.

If $m=n<i+1, r, s \geq i+1$ and $p \mid r-s$ or $m, n \geq i+1, p \mid m-n$ and $r=s<i+1$, then we have $m+r, n+s \geq i+1$ and $p l(m+r)-(n+s)$ hence, $\mathrm{x}^{\mathrm{m}+\mathrm{r}} \mathrm{\rho}_{[\mathrm{i}, \mathrm{p}]} \mathrm{x}^{\mathrm{n}+\mathrm{s}}$.

If $m, n \geq i+1, p \mid m-n, r, s \geq i+1$ and $p \mid r-s$ then we have $m+r, n+s \geq i+1$
and $\mathrm{p} \mid(\mathrm{m}+\mathrm{r})-(\mathrm{n}+\mathrm{s})$ hence, $\mathrm{x}^{\mathrm{m}+\mathrm{r}} \rho_{[\mathrm{i}, \mathrm{p}]} \mathrm{x}^{\mathrm{n}+\mathrm{s}}$. Thus, in all cases $\mathrm{x}^{\mathrm{m}+\mathrm{r}} \rho_{[i, p]} \mathrm{x}^{\mathrm{n}+\mathrm{s}}$. Therefore $\rho_{[i, p]}$ is a congruence on $F$. $\bullet$

Lemma 5.1.3. $\operatorname{ConF}=\{\mathfrak{i}\} \cup\left\{\rho_{[i, p]}:[i, p] \in M\right\}$.
Proof. Let $p \in \operatorname{ConF}, \rho \neq 1$. Then the set
$\left\{m \in\{1,2, \ldots\} \mid\right.$ there exists $n \in\{1,2, \ldots\}$ such that $\left.x^{m} \rho x^{n}, m \neq n\right\}$
is non empty and so has a least element $k$. Then the set

$$
\left\{r \in\{1,2, \ldots\}: x^{k} \rho x^{k+r}\right\}
$$

is non empty and so it too has a least element p .
First of all let $r \in\{1,2, \ldots\}$ be such that $x^{k} \rho x^{k+r}$. Then $r \geq p$ and so $r=a p+b$ for some integers $a$ and $b$ such that $a \geq 1,0 \leq b<p$. Hence, $k+r=k+a p+b$ and $x^{k} \rho x^{k+r}=x^{k+a p+b}=x^{k+a p} \cdot x^{b} \rho x^{k} \cdot x^{b}=x^{k+b}$. But then $b$ must be 0 since $p$ is the minimum of such elements, hence $p / r$.

Now let $0 \leq a<p$, and $x^{a} \rho x^{b}$ for some $b \in\{1,2, \ldots\}$. Then $x^{k+a} \rho x^{k+b}$. And, since $p-a>0, x^{k} \rho x^{k+p}=x^{k+a+(p-a)} \rho x^{k+b+(p-a)}$. Then, by the above, $p \mid b+p-a=p+(b-a)$. Hence $p \mid b-a$.

Finally, let $\mathrm{s}, \mathrm{t} \in\{1,2, \ldots\}$ be such that $\mathrm{s}, \mathrm{t} \geq \mathrm{k}$ and $\mathrm{x}^{s} \rho \mathbf{x}^{\mathrm{t}}$. Then $\mathrm{k}+\mathrm{ap} \leq \mathrm{s}<\mathrm{k}+(\mathrm{a}+1) \mathrm{p}$ and $\mathrm{k}+\mathrm{bp} \leq \mathrm{t}<\mathrm{k}+(\mathrm{b}+1) \mathrm{p}$. Hence $0 \leq \mathrm{s}-(\mathrm{k}+\mathrm{ap})<\mathrm{p}$. Since $s=k+a p+s-(k+a p)$ and $t=k+b p+t-(k+b p)$ it follows that:

$$
x^{s-a p}=x^{k} x^{s-(k+a p)} \rho x^{k+a p} x^{s-(k+a p)}=x^{s} \rho x^{t}=x^{k+b p} x^{t-(k+b p)} \rho x^{k} x^{t-(k+b p)}=x^{t-b p},
$$ and so, $x^{s-a p} \rho x^{t-b p}$. Then, by the above, we have that

$$
\mathrm{p} \mid(\mathrm{s}-\mathrm{ap})-(\mathrm{t}-\mathrm{bp})=\mathrm{s}-\mathrm{t}+\mathrm{p}(\mathrm{~b}-\mathrm{a}) .
$$

Hence $\mathrm{p} \mid \mathrm{s}-\mathrm{t}$. Now, by setting $\mathrm{i}=\mathrm{k}-1$, we have $\rho=\rho_{[i, p]} \cdot \bullet$

Lemma5.1.4. $\rho_{[i, p]} \leq \rho_{[k, r]}$ if, and only if $\mathrm{i} \geq \mathrm{k}$ and $\mathrm{r} \mid \mathrm{p}$.
Proof. First, let $\rho_{[i, p]} \leq \rho_{[k, r]}$. Then, by definition of $\rho_{[i, p],} x^{i+1} \rho_{[i, p]} x^{i+p+1}$ and so $x^{i+1} \rho_{[k, r]} x^{i+p+1}$. Then, since $i+1 \neq i+p+1$, we must have $i+1$ and $i+p+1 \geq k+1$, in particular $i+1 \geq k+1$ and so $i \geq k$, and $r \mid(i+p+1)-(i+1)=p$.

Conversely, let $i \geq k$ and $r \mid p$. If $m, n, \in\{1,2, \ldots\}$ are such that $x^{m} \rho_{[i, p]} x^{n}$ then either $m=n<i+1$ in which case $x^{m} \rho_{[k, r]} x^{m}=x^{n}$ or, $m, n \geq i+1$ and $p \mid m-n$ then, since $i+1 \geq k+1$ and $r \mid p$, we have $x^{m} \rho_{[k, r]} x^{n}$. Hence $\rho_{[\mathrm{i}, \mathrm{p}]} \leq \rho_{[\mathrm{k}, \mathrm{r}]} \cdot \bullet$

Let $\mathscr{C}_{\mathcal{M}}=\{\mathrm{c}: \mathrm{c}$ is a contraction in ConF$\}$. Let $\mathrm{c} \in \mathscr{C}_{\mathcal{M}}$ and $\rho \in \mathrm{ConF}$. Then, by Lemma 5.1.3, either $\rho=1$ or $\rho=\rho_{[i, p]}$ for some $[i, p] \in \mathscr{M}$. Note that, by $\mathrm{C}(\mathrm{i})$ in the definition of contraction, $\mathrm{f}(\mathrm{t})=\mathrm{l}$ for any contraction f . Therefore, it suffices to define the contraction on $\operatorname{ConF} \backslash\{\mathfrak{l}\}$ and so, we identify $\rho_{[i, p]}$ by [i,p]. Hence c can be regarded as a function from $\mathscr{M}$ into $\mathscr{M}$; i.e.,

$$
c:[i, p] \rightarrow[k, r]=\left[c_{1}(i, p), c_{2}(i, p)\right]
$$

We recognize that $[\mathrm{i}, \mathrm{p}]$ has two meanings, one being a congruence $\rho[\mathrm{i}, \mathrm{p}]$ and the other being the monogenic semigroup with index $i$ and period $p$, because of the close relation between the sets $\operatorname{ConF}$ and $\mathscr{M}$. However, we believe that there will be no confusion due to the context.

Proposition 5.1.5. $\mathrm{c} \in \mathscr{C}_{\mathcal{M}}$ if and only if c is of the form:

$$
\mathrm{c}:[\mathrm{i}, \mathrm{p}] \rightarrow\left[\mathrm{c}_{1}(\mathrm{i}, \mathrm{p}), \mathrm{c}_{2}(\mathrm{i}, \mathrm{p})\right]
$$

where $c_{1}$ and $c_{2}$ are functions of two variables satisfying the following conditions:
(i) $c_{1}(i, p) \geq i$ for any $i, p \in\{1,2, \ldots\}$;
(ii) $p \mid c_{2}(i, p)$ for any $i, p \in\{1,2, \ldots\}$;
(iii) if $\mathrm{i} \geq \mathrm{k}$ and $\mathrm{r} \mid \mathrm{p}$ then $\mathrm{c}_{1}(\mathrm{i}, \mathrm{p}) \geq \mathrm{c}_{1}(\mathrm{k}, \mathrm{r})$ and $\mathrm{c}_{2}(\mathrm{k}, \mathrm{r}) \mid \mathrm{c}_{2}(\mathrm{i}, \mathrm{p})$.

Proof. Let $c \in \mathscr{C}_{\mathcal{M}}$ be such that $c:[i, p] \rightarrow\left[c_{1}(i, p), c_{2}(i, p)\right]$. We will now show that $c_{1}$ and $c_{2}$ satisfy the above three conditions.

By $C(i)$ in the definition of contraction $c(\rho) \subseteq \rho$ for any $\rho \in \mathrm{ConF}$, that is, $\rho_{\left[c_{1}(\mathrm{i}, \mathrm{p}), c_{2}(\mathrm{i}, \mathrm{p})\right]} \subseteq \rho_{[\mathrm{i}, \mathrm{p}]}$. Then, by Lemma 5.1.4, $\mathrm{c}_{1}(\mathrm{i}, \mathrm{p}) \geq \mathrm{i}$ and $\mathrm{p} \mid \mathrm{c}_{2}(\mathrm{i}, \mathrm{p})$. Also, by $\mathrm{C}(\mathrm{ii})$ in the definition of contraction, if $\rho \subseteq \tau$ then $\mathrm{c}(\rho) \subseteq \mathrm{c}(\tau)$; i.e., if $\rho_{[\mathrm{i}, \mathrm{p}]} \subseteq \rho_{[k, r]}$ then $\rho_{\left[c_{1}(\mathrm{i}, \mathrm{p}), c_{2}(\mathrm{i}, \mathrm{p})\right]} \subseteq \rho_{\left[\mathrm{c}_{1}(\mathrm{k}, \mathrm{r}), \mathrm{c}_{2}(\mathrm{k}, \mathrm{r})\right]}$; that is, by Lemma 5.1.4, if $\mathrm{i} \geq \mathrm{k}$ and $\mathrm{r} \mid \mathrm{p}$ then $\mathrm{c}_{1}(\mathrm{i}, \mathrm{p}) \geq \mathrm{c}_{1}(\mathrm{k}, \mathrm{r})$ and $\mathrm{c}_{2}(\mathrm{k}, \mathrm{r}) \mid \mathrm{c}_{2}(\mathrm{i}, \mathrm{p})$.

Next, let c be a function as defined in the proposition. Let $\rho \in \mathrm{ConF}$,
 $p \geq c_{2}(i, p)$ and by Lemma 5.1.4, $c(\rho) \subseteq \rho$.

Let $\rho, \tau \in \operatorname{ConF}$ be such that $\rho \subseteq \tau$, say $\rho=\rho_{[i, p]}$ and $\tau=\rho_{[k, r]}$,
$[i, p],[k, r] \in \mathscr{M}$. Then, by Lemma 5.1.4, $i \geq k$ and $r \mid p$ and so, $c_{1}(i, p) \geq c_{1}(k, r)$ and $c_{2}(k, r) \mid c_{2}(i, p)$. Hence, $c(p)=\rho_{\left[c_{1}(i, p), c_{2}(i, p)\right]} \subseteq \rho_{\left[c_{1}(k, r), c_{2}\left(k_{,}, r\right)\right]}=c(\tau)$ by Lemma 5.1.4. Thus $\mathrm{c} \in \mathscr{B}_{\boldsymbol{a}} . \bullet$

Example 5.1.6. Define c: $\mathcal{M} \rightarrow \mathscr{M}$ by

$$
c:[\mathrm{i}, \mathrm{p}] \rightarrow\left[\mathrm{i}+\mathrm{p}, 2^{\mathrm{i}} \cdot \mathrm{p}\right]
$$

Then for $[i, p] \in \mathbb{M}$ we have that $c_{1}(i, p)=i+p \geq i$ and $p \mid c_{2}(i, p)=2^{i} \cdot p$ and for $i \geq k$ and $r \mid p$ we have $c_{1}(i, p)=i+p \geq k+r=c_{1}(k, r)$ and $c_{2}(k, r)=2^{k} \cdot r \mid 2^{i} \cdot p=c_{2}(i, p)$. Hence $c \in \mathscr{C}_{\mathcal{A}}$.

### 5.2. The expansions in $\mathscr{M}^{\sim}$

In this section we turn our attention to the expansions in the category of monogenic semigroups $\mathscr{A}$. We define these expansions and we give the order in the lattice of expansions in this category.

Let $\mathscr{E}_{\mathscr{M}}=\{\mathrm{E}: \mathrm{E}$ is an expansion in $\mathscr{M}\}$. Since $\mathrm{F} / \rho_{[\mathrm{i}, \mathrm{p}]} \cong[\mathrm{i}, \mathrm{p}]$ and we have the anti-isomorphisms $\Phi$ and $\Psi$ we have that $\mathcal{E}_{\mathcal{M}}=\mathcal{E}_{\mathcal{M}}$. We remark that the relation $\leq$ in $\mathscr{E}_{\mathcal{K}}$ is the reverse of the relation $\leq$ in $\mathscr{C}_{\mathcal{K}}$.

We have the relation $\leq$ in $\mathcal{E}_{\mathcal{M}}$,as defined previously in $\mathscr{\mathscr { E }}$, as follows :
For $E, F \in \mathscr{E}_{\mathcal{M}}$, where $E=\left(e_{1}, e_{2}\right)$ and $F=\left(f_{1}, f_{2}\right), E \leq F$ if and only if there exists an epimorphism $\varphi_{[i, p]}$ from $F([i, p])$ onto $E([i, p])$ for any $[i, p] \in \mathscr{M}$; that is $E \leq F$ if and only if $e_{1}(i, p) \geq f_{1}(i, p)$ and $f_{2}(i, p) \mid e_{2}(i, p)$.

In contrast to the situation in general for expansions this is clearly a partial order on $\mathscr{E}_{\mathcal{M}}$. In fact, $\mathscr{E}_{\mathcal{K}}$ is a lattice where the join and the meet of two expansions are given as in the proceeding proposition.

Proposition 5.2.1. For $\mathrm{E}, \mathrm{F} \in \mathscr{E}_{\mathcal{M}}$, where $\mathrm{E}=\left(\mathrm{e}_{1}, \mathrm{e}_{2}\right)$ and $\mathrm{F}=\left(\mathrm{f}_{1}, \mathrm{f}_{2}\right)$

$$
\begin{aligned}
& E \vee F=J=\left(j_{1}, j_{2}\right) \quad \text { where } \quad j_{1}(i, p)=\max \left\{e_{1}(i, p), f_{1}(i, p)\right\} \\
& \mathrm{j}_{2}(\mathrm{i}, \mathrm{p})=\text { l.c.m. }\left\{\mathrm{e}_{2}(\mathrm{i}, \mathrm{p}), \mathrm{f}_{2}(\mathrm{i}, \mathrm{p})\right\},
\end{aligned}
$$

and
$E \wedge F=M=\left(m_{1}, m_{2}\right)$ where $m_{1}(i, p)=\min \left\{e_{1}(i, p), f_{1}(i, p)\right\}$

$$
\mathrm{m}_{2}(\mathrm{i}, \mathrm{p})=\text { g.c.d. }\left\{\mathrm{e}_{2}(\mathrm{i}, \mathrm{p}), \mathrm{f}_{2}(\mathrm{i}, \mathrm{p})\right\} .
$$

Proof. It is clear that $J \in \mathcal{X}_{\mathcal{M}}$ and $J \geq E, F$. Let $G=\left(g_{1}, g_{2}\right) \in \mathcal{E}_{\mathcal{M}}$ be such that $G \geq E$ and $G \geq F$. Then $g_{1}(i, p) \geq e_{1}(i, p)$ and $g_{1}(i, p) \geq f_{1}(i, p)$ and so $g_{1}(\mathrm{i}, \mathrm{p}) \geq \max \left\{\mathrm{e}_{1}(\mathrm{i}, \mathrm{p}), \mathrm{f}_{1}(\mathrm{i}, \mathrm{p})\right\}=\mathrm{j}_{1}(\mathrm{i}, \mathrm{p})$. Also, since $e_{2}(\mathrm{i}, \mathrm{p}) \mid \mathrm{g}_{2}(\mathrm{i}, \mathrm{p})$ and $f_{2}(i, p)\left|g_{2}(i, p) \quad j_{2}(i, p)=1 . c . m .\left\{e_{2}(i, p), f_{2}(i, p)\right\}\right| g_{2}(i, p)$. Hence, $G \geq J$ and consequently $\mathrm{J}=\mathrm{E} \vee \mathrm{F}$.

It is also clear that $M \in \mathcal{X}_{\mathcal{M}}$ and $\mathrm{M} \leq \mathrm{E}, \mathrm{F}$. Let $\mathrm{H}=\left(\mathrm{h}_{1}, \mathrm{~h}_{2}\right) \in \mathscr{E}_{\mathcal{M}}$ be such that $H \leq E$ and $H \leq F$. Then $e_{1}(i, p) \geq h_{1}(i, p)$ and $f_{1}(i, p) \geq h_{1}(i, p)$ and so $h_{1}(i, p) \leq \min \left\{e_{1}(i, p), f_{1}(i, p)\right\}=m_{1}(i, p)$. Also, since $h_{2}(i, p) \mid e_{2}(i, p)$ and $\mathrm{h}_{2}(\mathrm{i}, \mathrm{p})\left|\mathrm{e}_{2}(\mathrm{i}, \mathrm{p}), \mathrm{h}_{2}(\mathrm{i}, \mathrm{p})\right|=$ g.c.d. $\left\{\mathrm{e}_{2}(\mathrm{i}, \mathrm{p}), \mathrm{f}_{2}(\mathrm{i}, \mathrm{p})\right\}=\mathrm{m}_{2}(\mathrm{i}, \mathrm{p})$. Hence, $\mathrm{H} \leq \mathrm{M}$ and consequently $\mathrm{M}=\mathrm{E} \wedge \mathrm{F} . \bullet$

For expansions in $\mathscr{M}$ we have the following compatibility conditions.

Proposition 5.2.2. Let $\mathrm{E}, \mathrm{F}$ and $\mathrm{G} \in \mathcal{8}_{\mathcal{M}}, \mathrm{E}=\left(\mathrm{e}_{1}, \mathrm{e}_{2}\right), \mathrm{F}=\left(\mathrm{f}_{1}, \mathrm{f}_{2}\right)$ and $\mathrm{G}=\left(\mathrm{g}_{1}, \mathrm{~g}_{2}\right)$. Then $(\mathrm{E} \wedge \mathrm{F}) \cdot \mathrm{G}=\mathrm{E} \cdot \mathrm{G} \wedge \mathrm{F} \cdot \mathrm{G}$ however, $\mathrm{G}(\mathrm{E} \wedge \mathrm{F}) \leq \mathrm{G} \cdot \mathrm{E} \wedge \mathrm{G} \cdot \mathrm{F}$
but $G(E \wedge F)$ is not necessarily equal to $G \cdot E \wedge G \cdot F$.
Proof. Let $[\mathrm{i}, \mathrm{p}] \in \mathscr{M}$. Then,

$$
\begin{aligned}
{[(E \wedge F) \cdot G]([i, p]) } & =(E \wedge F)(G([i, p]))=(E \wedge F)\left(\left[g_{1}(i, p), g_{2}(i, p)\right]\right) \\
& =\left[m_{1}(i, p), m_{2}(i, p)\right]
\end{aligned}
$$

where $m_{1}(i, p)=\min \left\{e_{1}\left(\left[g_{1}(i, p), g_{2}[i, p]\right), f_{1}\left(\left[g_{1}(i, p), g_{2}(i, p)\right]\right\}\right.\right.$ and

$$
m_{2}(i, p)=\text { g.c.d. }\left\{e _ { 2 } \left(\left[g_{1}(i, p), g_{2}[i, p]\right), f_{2}\left(\left[g_{1}(i, p), g_{2}(i, p)\right]\right\}\right.\right.
$$

On the other hand,
$(E \cdot G \wedge F \cdot G)([i, p])=\left[\min \left\{e_{1}\left(\left[g_{1}(i, p), g_{2}[i, p]\right), f_{1}\left(\left[g_{1}(i, p), g_{2}[i, p]\right)\right\}\right.\right.\right.$,
g.c.d. $\left\{e_{2}\left(\left[g_{1}(i, p), g_{2}[i, p]\right), f_{2}\left(\left[g_{1}(i, p), g_{2}[i, p]\right)\right\}\right]\right.$.

Therefore, $(E \wedge F) \cdot G=E \cdot G \wedge F \cdot G$.
First of all since $E \wedge F \leq E, F$ we have that $G \cdot(E \wedge F) \leq G \cdot E, G \cdot F$.
Hence, $G \cdot(E \wedge F) \leq G \cdot E \wedge G \cdot F$. Now we will give an example for which
$G \cdot(E \wedge F)$ is not equal to $G \cdot E \wedge G \cdot F$. Define $E, F$ and $G$ by

$$
\begin{aligned}
& e_{1}(i, p)=e_{1}(i)=f_{1}(i, p)=f_{1}(i)=g_{1}(i, p)=g_{1}(i)=i \\
& e_{2}(i, p)=e_{2}(p)= \begin{cases}p & \text { if } p \neq 2 \\
4 & \text { if } p=2\end{cases} \\
& f_{2}(i, p)=f_{2}(p)= \begin{cases}p & \text { if } 2 \text { does not divide } p \\
6 k & \text { if } p=2 k\end{cases}
\end{aligned}
$$

and

$$
g_{2}(i, p)=g_{2}(p)= \begin{cases}10 k & \text { if } p=2 k \text { and } k \in N \backslash\{1\} \\ p & \text { otherwise }\end{cases}
$$

It is easy to verify that $E, F$ and $G \in \mathscr{E}_{\mathcal{M}}$. Then for $[\mathrm{i}, \mathrm{p}]=[2,2]$ we have that

$$
\begin{aligned}
(\mathrm{G} \cdot(\mathrm{E} \wedge \mathrm{~F}))([2,2])= & \mathrm{G}\left(\left[\min \left\{\mathrm{e}_{1}(2), \mathrm{f}_{1}(2)\right\}, \text { g.c.d. }\left\{\mathrm{e}_{2}(2), \mathrm{f}_{2}(2)\right\}\right]\right) \\
& =\mathrm{G}([2, \text { g.c.d. }\{4,6\}])=\mathrm{G}([2,2])=[2,2]
\end{aligned}
$$

However,
$(G \cdot E \wedge G \cdot F)([2,2])=\left[\min \left\{g_{1}\left(e_{1}(2)\right), g_{1}\left(f_{1}(2)\right)\right\}\right.$, g.c.d. $\left.\left\{g_{2}\left(e_{2}(2)\right), g_{2}\left(f_{2}(2)\right)\right\}\right]$

$$
\begin{aligned}
& =\left[\min \{2,2\}, \text { g.c.d. }\left\{g_{2}(4), g_{2}(6)\right\}\right] \\
& =[2, \text { g.c.d. }\{20,30\}]=[2,10] .
\end{aligned}
$$

Thus, we have $G \cdot(E \wedge F) \neq G \cdot E \wedge G \cdot F$ in this case.

Remark5.2.3. The dual result holds for the joins; that is, $(E \vee F) \cdot G=E \cdot G \vee F \cdot G$ and $\quad G \cdot(E \vee F) \geq G \cdot E \vee G \cdot F$ but $G \cdot(E \vee F)$ is not necessarily equal to G•E $\vee G \cdot F$.
