16

**17 Abstract**

18

19 The food and agriculture biotechnology (FAB) sector is poised to respond to  
20 some of society's most pressing challenges, including food security, climate  
21 change, population growth, and resource limitation. However, to realize this  
22 promise, substantial barriers to innovation must be overcome. Here, we draw  
23 upon industry experience and innovation management literature to analyze FAB  
24 innovation challenges, as well relevant frameworks for their resolution. In doing  
25 so, we identify two major FAB innovation challenges: specialized adoption  
26 uncertainty, and complex product-market fit across convergent value chains. We  
27 propose that these innovation challenges may be overcome by 1) prioritizing the  
28 establishment of organizational and social technology legitimacy, and 2)  
29 leveraging technology-market matching methods and open innovation practices.

40 public, commercial, or not-for-profit sectors.

41

## 42 **Background**

43

44 Food and Agricultural Biotechnology (FAB) encompasses technology innovation  
45 designed to improve plants, animals, and microorganisms, as well as their  
46 cultivation, processing and use, so as to increase their economic, social, and  
47 health-related value. As such, the sector is comprised of a broad collection of  
48 innovation areas encompassing technologies that respond to changing consumer  
49 preferences in food production and consumption, opportunities in nutritional  
50 supplementation and preventative healthcare for humans and animals, issues of  
51 food security and environmental sustainability, the transition towards a 'bio-  
52 based' economy and green chemistry alternatives to synthetics, and enabling  
53 novel material use such as bio-plastics and/or specialty ingredients (**Table 1**).

54

55 Although still emerging as a standalone innovation area, the FAB sector has  
56 seen immense growth over the past five years, and has attracted significant  
57 investment activity from angel investors, private equity, incubators and  
58 accelerators, as well as venture capital (VC) firms (both broad biotechnology  
59 funds and FAB-specific corporate VCs). In 2016 alone, there were a reported 580  
60 FAB sector financing deals globally—worth approximately \$3.2 billion USD—  
61 made with over 650 unique investors, including 14 dedicated VC FAB funds  
62 worth nearly \$850 million USD<sup>1</sup>. Moreover, since 2014 over \$10 billion USD has  
63 been invested into the FAB sector, compared with only \$2.3 billion USD invested  
64 in total between 2010 and 2013<sup>1</sup>. While these figures highlight the substantial  
65 growth of the FAB sector, the industry as a whole is still in its infancy. For  
66 example, the broader biotechnology/biopharmaceutical (healthcare) sector in the  
67 US attracted over \$11 billion USD investment in 2016 alone, out of the total  
68 \$58.6 billion USD invested in the US that year and the approximately \$100 USD  
69 invested globally<sup>2</sup>. Importantly, 57% of 2016 FAB sector investments were at the

70 Seed stage<sup>1</sup>, which further highlights the nascent nature of the FAB sector, but  
71 also signals its substantial promise for innovation at the intersection of existing  
72 industries.

73

74 Undoubtedly, one of the driving forces for investment and growth in the FAB  
75 sector is the need for, and promise of, technological solutions to important food  
76 and agricultural issues. Food quality and security are fundamental to the health  
77 and well-being of societies worldwide, yet today unprecedented population  
78 growth, resource limitation, and climate change are beginning to challenge our  
79 ability to feed ourselves in never-before-seen ways (Boehlje & Bröring, 2011;  
80 Boehlje, Roucan-Kane, & Bröring, 2011; Raiten & Aimone, 2017). The successful  
81 development and deployment of innovative technologies by focused, agile, and  
82 opportunistic FAB ventures can help overcome these challenges. However, in  
83 order to be successful in technology commercialization, FAB ventures must be  
84 cognizant of the barriers to innovation they may face and, more importantly,  
85 develop proactive strategies to cope with the aforementioned challenges. Indeed,  
86 the evolution of novel technologies, such as synthetic biology, robotics, and  
87 applied data science, as well as the emergence of the bio-economy, highlights  
88 the substantial need for an innovation management lens to be applied to the food  
89 and agricultural biotechnology sector.

90

91 In response, we draw upon technology and innovation management literature to  
92 analyze the FAB sector, thereby positioning it within the broader context of  
93 science-based ventures (SBVs) and the technology sector as a whole. Moreover,  
94 we utilize our collective academic and industrial experience in science &  
95 technology entrepreneurship, commercialization strategy, and diffusion of  
96 technology in converging industries (especially food and beverage), to identify  
97 and examine innovation challenges particularly pertinent to the FAB sector. This  
98 examination contextualizes each challenge within a specific innovation  
99 management framework in order to highlight 1) why the challenge is particularly  
100 relevant to the FAB sector, and 2) how the challenge may be addressed through

101 applied innovation management frameworks. To the best of our knowledge, this  
102 commentary is one of the first examinations of barriers to innovation in the  
103 emergent FAB sector, with the aim of increasing awareness of innovation  
104 management approaches that may be useful in promoting successful FAB  
105 technology development and deployment.

### 107 **Positioning of the FAB sector—Innovation challenges shared with other** 108 **SBVs**

109  
110 Technological innovation can be broadly divided into two basic categories—one  
111 in which technology uncertainty is low, i.e. existing and/or near-term technologies  
112 are applied to yet-unresolved engineering problems; and, another in which  
113 technology uncertainty is high, i.e. solution engineering requires novel research  
114 yielding advances in fundamental scientific knowledge in order to be successful  
115 (Bröring, Leker, & Ruhmer, 2006a; Garcia & Calantone, 2002; O'Connor, 1998).

116  
117 Accordingly, technology innovators that comprise the latter category—often  
118 referred to as Science Based Ventures (SBVs) and defined as those who attempt  
119 to “not only use existing science but also to advance scientific knowledge and  
120 capture the value of the knowledge it creates” (Pisano, 2006)—face significant  
121 barriers to successful technology development and deployment. These  
122 challenges have been broadly documented in the past, particularly in the context  
123 of advanced materials and nanotechnology ventures (Maine & Seegopaul, 2016),  
124 and may include the following: 1) large capital requirements for research and  
125 development (> \$5-10M), 2) extended technology readiness timeframes (> 5-10  
126 years), 3) the need for co-innovation to ensure technology adoption (ventures are  
127 typically upstream in value chain and business-to-business (B2B)-focused), 4)  
128 highly interdisciplinary knowledge requirements for research and development  
129 (R&D), 5) high technology uncertainty (especially for biological based  
130 technologies), and 6) high market and adoption uncertainty (especially for  
131 platform technologies, radical or disruptive innovations, or technologies that are

132 highly visible yet unfamiliar to the public) (Hall, Bachor, & Matos, 2014; Maine &  
133 Garnsey, 2006; Maine & Seegopaul, 2016; Pisano, 2010). Of note, these  
134 challenges stand in contrast to those facing other non-SBV technology-driven  
135 industries such as the information and communication technology (ICT) sector,  
136 which is characterized by low technology and market uncertainty, relatively low  
137 capital requirements, and short timeframes for commercialization (Cusumano,  
138 MacCormack, & Kemerer, 2009; MacCormack & Verganti, 2003) (Figure 1).

139

140 Notwithstanding ICT-type food and agriculture technologies, FAB ventures are  
141 more closely aligned to SBVs than other technology innovation sectors (Figure  
142 1). Indeed, many of the most promising FAB innovation categories, namely  
143 agricultural biotechnology, bioenergy and biomaterials, and innovative food, all  
144 face high technology uncertainty and must perform fundamental interdisciplinary  
145 research in diverse areas such as microbiology, genetics, human and animal  
146 nutrition, immunology, polymer and enzyme chemistry, bioengineering, synthetic  
147 biology, etc. As such, it is clear that the FAB sector must address the same  
148 broad set of barriers to innovation that affect other SBVs.

149

150 However, given that the sector seeks to bring radical innovation to otherwise low  
151 technology intensive industries with relatively low R&D spending and a culture of  
152 incremental, process-driven innovation (Trott & Simms, 2017), it is clear that the  
153 FAB ventures must also overcome a set of sector-specific innovation challenges.

154

155

156

### 157 **Positioning of the FAB Sector—Sector-specific innovation challenges**

158

159 In addition to the broad innovation challenges facing SBVs, FAB ventures face a  
160 number of sector-specific barriers to innovation that arise from the application of  
161 biotechnology into a complex food and agriculture sector with substantial  
162 specialized technology and market adoption drivers, most notably vested

163 consumer interest in an otherwise business-to-business sector (Figure 1 and  
164 Table 2). Of note, while these challenges are not necessarily exclusive to the  
165 FAB sector, they are likely to be particularly relevant to radically innovative FAB  
166 ventures seeking to make major changes to the technological status quo of the  
167 food and agriculture industries.

168

169 In the next section, we examine two specific, yet strongly interconnected, FAB-  
170 sector challenges—specialized adoption uncertainty, and product-market fit  
171 across industry convergence-affected value chains—within the context of  
172 relevant innovation management frameworks. Indeed, we find that the FAB  
173 sector is subject to several convergence processes at the technology (e.g.  
174 genomics, biotechnology) and market (e.g. hybrid products such as preventative  
175 foods or personalized nutrition) levels. This both creates and reinforces  
176 specialized adoption uncertainty at the technological, commercial, organizational,  
177 and societal levels, which perpetuates the already complex challenge of finding  
178 the right product-market combination in hybrid convergent value chains and  
179 industries.

180

181 *Innovation Challenge 1: Obtaining Sociopolitical Legitimacy to Mitigate Adoption*  
182 *Uncertainty in Highly Visible FAB Markets*

183

184 Uncertainty is an inherent component of innovation and, much like the more  
185 general category of SBVs, FAB ventures face a high degree of both technology  
186 and market uncertainty. However, given the positioning of the FAB sector at the  
187 confluence of food, agriculture, and biotechnology, FAB ventures also encounter  
188 unique uncertainties stemming from food's inextricable link to our identity as  
189 individuals, cultures, and societies (Hall et al., 2014) (**Table 2**). This creates  
190 complex adoption uncertainties at the organizational and societal levels.

191

192 For example, growing consumer demands for transparency and traceability  
193 within the ingredient and food supply chain (Duarte Canever, Van Trijp, & Beers,

194 2008; Pant, Prakash, & Farooque, 2015; Trienekens, Wognum, Beulens, & van  
195 der Vorst, 2012; Wognum, Bremmers, Trienekens, van der Vorst, & Bloemhof,  
196 2011) highlights the changing nature of organizational uncertainty in the FAB  
197 sector, where conventional food technology appropriability regimes, i.e. trade  
198 secrets and proprietary knowledge of process and formulation innovation  
199 (Alfranca, Rama, & Tunzelmann, 2002; Arundel, 2001; Leiponen & Byma, 2009),  
200 may no longer be suitable for value creation and capture. Likewise, the ongoing  
201 debate between the scientific community and the consuming public (Leshner,  
202 2015) over foods derived from genetically modified organisms (GMOs) highlights  
203 the power of societal uncertainty, and especially issues of risk perception,  
204 emotionality, tradition, and public opinion, on the adoption of FAB derived  
205 products.

206

207 How then do FAB ventures successfully develop and deploy innovations in a  
208 highly uncertain ecosystem where organizational and societal pressures have  
209 significant consequences on technology adoption? One approach may be to  
210 prioritize a structured and holistic analysis of technology, commercial,  
211 organizational and societal (TCOS) uncertainties, so as to facilitate the  
212 establishment of overall technology 'legitimacy' in two key areas—cognitive and  
213 socio-political (Hall et al., 2014) (**Table 3**).

214

215 Within such a framework, cognitive legitimacy is defined as the “knowledge about  
216 the new activity and what is needed to succeed in an industry” (Hall et al., 2014).  
217 More specifically, this type of legitimacy refers to overcoming both technological  
218 and commercial uncertainty. Technological uncertainty relates to barriers on the  
219 scientific research, development, and engineering of a technology. Key forms of  
220 technological uncertainty include design and utility challenges, technology  
221 functionality, scale-up issues, etc. Importantly, although technological uncertainty  
222 in FAB ventures—as well as SBVs as a whole—is often very high, it is the form  
223 of uncertainty that is most well understood and directly controlled by a venture.  
224 On the other hand, commercial uncertainty is concerned with a technology's

225 value proposition and competitive advantage in the marketplace. Key questions  
226 in this area are how and where a technology fits into the value chain, whether or  
227 not it can compete with less expensive or more effective alternatives, and if co-  
228 innovations are necessary to drive market adoption. These forms of uncertainty  
229 are also generally well understood and can be mitigated by careful analysis of  
230 the competitive landscape, as well as the entire system into which a technology  
231 is embedded.

232

233 On the other hand, socio-political legitimacy is defined as the “the value placed  
234 on an activity by cultural norms and political influences” (Hall et al., 2014), and is  
235 concerned with overcoming both organizational and societal uncertainty.

236 Organizational uncertainty relates to the strength of an organization’s  
237 appropriability regime with respect to a given technology. That is, how well is an  
238 organization able to create and capture value from the technological innovation  
239 that it creates (Teece, 1986). Key questions include how a venture invests its  
240 resources with respect to being either control or execution focused within a value  
241 chain, as well as how a venture orients itself with respect to collaborating or  
242 competing into a value chain — each of these factors influences a venture’s  
243 choice of business model. Meanwhile, societal uncertainty is concerned with the  
244 social and political impacts of the technology and how diverse sets of  
245 stakeholders may respond and influence an innovation’s success. Key questions  
246 include which groups will be invested in a technology’s implementation, what  
247 power and influence do stakeholders have in determining a technology’s  
248 legitimacy in the marketplace, and how can stakeholder reactions be predicted  
249 and, if negative, mitigated.

250

251 Given the close cultural and social links to food and agriculture, FAB ventures  
252 should be particularly concerned with establishing sociopolitical legitimacy so as  
253 to avoid costly organizational and societal adoption barriers. With respect to  
254 organizational uncertainty, a key issue for FAB ventures to consider is the nature  
255 of the appropriability regime used to create and capture value from innovation

256 and, more specifically, how such regimes may impact—and be impacted by—  
257 consumer viewpoints. Indeed, increasing consumer demands for transparency,  
258 labeling, education, and, ultimately, choice over novel foods, food ingredients  
259 and other biotechnology-enabled foods (BEFs) necessitates that FAB ventures  
260 critically evaluate the utility of conventional food and beverage sector  
261 appropriability regimes (Duarte Canever et al., 2008; Pant et al., 2015;  
262 Trienekens et al., 2012; Wognum et al., 2011). Moreover, the ubiquity and  
263 accessibility of social media has enabled active consumer engagement with  
264 companies, as well as discussion amongst consumers (Rutsaert et al., 2013),  
265 thereby accelerating demands for transparency in knowledge and potentially  
266 compounding consequences of poor strategic decision making.

267  
268 Historically, new product and technology development in the food and beverage  
269 sector has occurred through incremental process and formulation innovation  
270 (Boehlje et al., 2011; Boehlje & Bröring, 2009; Lefebvre, De Steur, & Gellynck,  
271 2015; Trott & Simms, 2017)—these types of innovation generally lend  
272 themselves to appropriation through trade secrets, proprietary information, and  
273 other ‘closed’ forms of knowledge control (Arundel, 2001; Leiponen & Byma,  
274 2009; Lemper, 2012; Thomä & Bizer, 2013). However, in a new marketplace with  
275 educated consumers demanding transparency, such appropriability regimes  
276 may, at best, delay technology adoption or, at worst, foster active distrust and  
277 advocacy against a given technology. Indeed, knowledge, perception, and  
278 attitude are among key intrinsic factors thought to drive food and agricultural  
279 technology adoption, as evidenced by evaluation of GMO seed and crop  
280 technology adoption in developing countries (Meijer, Catacutan, Ajayi, Sileshi, &  
281 Nieuwenhuis, 2014).

282  
283 As an alternative to ‘closed’ appropriability regimes, FAB ventures may seek to  
284 utilize patents and/or other intellectual property rights as a means to protecting  
285 and monetizing their intellectual property. Such approaches are arguably more  
286 transparent than the use of trade secrets; however, a patent-driven strategy may

287 also be problematic for a number of reasons. Firstly, the acquisition and  
288 maintenance of patents can be prohibitively expensive, especially for resource-  
289 limited ventures. Secondly, the enforceability and/or protection of patents may be  
290 difficult in certain jurisdictions, especially developing countries with limited patent  
291 laws (Hall et al., 2014). Thirdly, strong patent regimes requiring control by a  
292 select group of stakeholders may be prohibitive to collaborative R&D and open  
293 innovation practices (Laursen & Salter, 2014), which are thought to be crucial for  
294 innovation in the FAB sector (Pellegrini, Lazzarotti, & Manzini, 2014; Saguy &  
295 Sirotinskaya, 2014; Sarkar & Costa, 2008). Lastly, even though strong, patent-  
296 enabled appropriability regimes are more transparent than trade secret-based  
297 regimes, consumers may still take exception to the level of authority and  
298 restriction exerted by patent holders seeking to enforce their patents—indeed,  
299 such a response has been seen previously towards multiple seed and crop  
300 technologies owned by multinational agribusinesses (Hall et al., 2014).

301  
302 With respect to societal uncertainty, public concerns surrounding GMOs and  
303 BEFs create an extremely high degree of specialized adoption uncertainty for  
304 ventures. This is perpetuated by the fact that many FAB ventures create  
305 technologies with high consumer visibility and impact (i.e. affecting food  
306 production, manufacturing, and nutrition), despite the fact that the sector as a  
307 whole occupies an upstream position in the value chain and thus is business-to-  
308 business oriented (i.e. process innovation for agriculture, novel ingredients, etc.).  
309 Moreover, this upstream positioning in the value chain presents challenges for  
310 FAB ventures trying to communicate with end-customers, gather social and  
311 market intelligence, and interface with downstream users of their technology,  
312 especially if co-innovation and/or education is needed to drive adoption (Maine &  
313 Seegopaul, 2016). In this way, novel ingredients and functional food ventures  
314 may face particularly acute adoption uncertainty in the form of consumer  
315 reticence towards BEFs. For example, Golden Rice—a genetically modified rice  
316 varietal engineered for Vitamin A enrichment—was never successfully  
317 commercialized due to anti-GMO sentiment, despite being technologically sound

318 (Hall et al., 2014). Moreover, it is possible that even if FAB firms do not employ  
319 GMO technology—or are outside of the life sciences for that matter, e.g.  
320 agricultural data science or food processing technologies—consumer  
321 perceptions of “unnatural” foods, so called “food neophobia” (Schnettler et al.,  
322 2013), may create significant barriers to adoption.

323

324 Although a decade ago the negative public perceptions of GMOs and other BEFs  
325 were primarily attributed to a lack of education (Brossard, Shanahan, & Nesbitt,  
326 2007; Cuite, Aquino, & Hallman, 2005), it is now well recognized that the factors  
327 shaping public opinion are complex, multifaceted contextual factors (Butkowski,  
328 Pakseresht, Lagerkvist, & Bröring, 2017), centering around subjective risk  
329 perception (Slovic, 1987). For instance, a recent study revealed that consumer  
330 risk perception associated with plant biotechnology differs depending on the  
331 application area (food vs. bioenergy) and is lower for applications in bioenergy  
332 (Butkowski et al., 2017). Recent studies have revealed that people tend to  
333 interpret information about BEFs in personally relevant ways, depending on their  
334 specific level of involvement; therefore, conversations about BEFs must take the  
335 form of more than just education (Blancke, Grunewald, & De Jaeger, 2017).  
336 Indeed, for both scientifically educated people and the general public alike, past  
337 experience, values, social norms, and technology application area all contribute  
338 to the contextualization of risk perception and decision-making (Bray & Ankeny,  
339 2017; Christoph, Bruhn, & Roosen, 2008; Frewer et al., 2011; Knight, 2006).  
340 Critically however, additional education is likely to be useful in increasing the  
341 sophistication of public knowledge about BEFs so as to enable people to  
342 differentiate and evaluate BEFs objectively on function and application, rather  
343 than viewing all products in broad categories and/or through the same lens. This  
344 in turn helps promote case-by-case decision-making rather than, potentially  
345 uninformed, catchall judgments (Christoph et al., 2008; Knight, 2006), which are  
346 problematic since genetic engineering and biotechnology is simply a set of tools  
347 that may be used for any purpose, regardless of the objective and/or subjective  
348 value of the target. Moreover, as the debate surrounding GMOs and other BEFs

349 involves many complex non-scientific topics, scientists, science communicators,  
350 policy makers, and industry—including FAB ventures—should embrace proactive  
351 and transparent communication about their research and technologies  
352 (Lewandowsky, Mann, Brown, & Friedman, 2016), especially focusing on  
353 understanding consumer viewpoints so as to debate on common ground  
354 (Blancke et al., 2017).

355

356 *Innovation Challenge 2: Determining Product-Market Fit in Interconnected and*  
357 *Convergent FAB Markets*

358

359 Determining product-market fit—often defined as “being in a good market with a  
360 product that can satisfy that market” (Blank, 2005)—, is often one of the most  
361 critical aspects of successful innovation, both for aligning required product  
362 performance characteristics with customer needs (Nobel, 2011), as well as for  
363 enabling customer creation/growth and the scaling of a venture (Blank, 2005).

364

365 Although a challenge in many sectors, establishing product-market fit can be  
366 even more complex in the FAB sector due to the prevalence of innovations that  
367 span highly interconnected and convergent markets (**Table 2**). Indeed, many of  
368 the innovation opportunities in the FAB sector are driven by industry  
369 convergence of existing value chains to either create complementary value  
370 chains enabling new industries (e.g. nutraceuticals, functional foods, probiotics),  
371 or else substitutive value chains driving alternative, technology augmented  
372 industries (e.g. food e-commerce, drones/robotics, bioenergy, ‘green’ chemistry).  
373 As such, convergence-driven, alternative value chains present FAB ventures with  
374 specialized challenges in absorptive capacity—i.e. the ability to acquire and  
375 internalize different technological and market-related knowledge required to  
376 compete effectively in convergent industries (Cohen & Levinthal, 1990)—which  
377 can be costly for firms, especially early-stage ventures that are resource-limited  
378 (Bröring & Leker, 2007).

379

380 The product-market fit challenge is further compounded in the case of platform  
381 technologies—those which “will yield benefits for a wide range of sectors of the  
382 economy and/or society” (Keenan, 2003)—spanning convergent industries.  
383 Examples of such technologies in the FAB sector are platform farm management  
384 and food supply chain technologies that are broadly applicable; however,  
385 differences in crop type, geography, and supply chain structure necessitate  
386 differential implementation of the technology in each market (Fuglie & Kascak,  
387 2001). Similarly, innovative food technologies, such as alternative proteins, bio-  
388 based ingredients, and recombinant enzyme production all utilize common  
389 technology tool sets (i.e. synthetic biology and microbial fermentation) for their  
390 development; however, differences in target technology application and, more  
391 importantly, market considerations require careful evaluation of each instance of  
392 the platform technology. For example, the use of synthetic biology and genetic  
393 engineering in medical/pharmaceutical applications has paradoxically been well  
394 tolerated by consumers (Marris, 2001); yet, the same platform technology is  
395 minimally tolerated in agricultural and food applications, thereby necessitating  
396 case-by-case analysis of adoption barriers and investment of specific resources  
397 to overcome application-specific technological and market uncertainty.

398

399 It is clear that the convergence of once-disparate industries driving the  
400 emergence of novel value chains (Bröring, 2010) can create new space for  
401 successful innovation in new markets, but it also places extra demands on firms  
402 who wish, or are forced, to access the convergence-driven value chains. Firms  
403 are forced to simultaneously manage the research, development, and application  
404 requirements of the convergent technologies, as well as the complexities of  
405 distinct consumer markets, new competitive landscapes, emerging regulatory  
406 frameworks, innovation cycles and adoption timeframes, etc. Because of this  
407 convergence, the required knowledge for success is often outside a firm’s core  
408 competencies, thus leaving firms with a substantial gap in absorptive capacity.

409

410 Industry convergence is primarily driven by two main factors—input-side

411 technology-driven convergence, and output-side market-driven convergence  
412 (Bröring, Martin Cloutier, & Leker, 2006b). In the former, the use of similar  
413 technologies across different industries, design solutions, or the re-application of  
414 existing knowledge can all promote convergence—this is especially true in the  
415 FAB sector where many of the venture categories apply externally developed  
416 technologies (i.e. genomics, nanotechnologies, nutritional and medical biology,  
417 Artificial Intelligence, robotics, etc.) in new applications, such as microbial  
418 engineering for food and flavor production, Internet-of-Things and robotics  
419 enhancement of agriculture, etc. (Saguy & Sirobinskaya, 2014). On the output-  
420 side, market-driven social and political trends, as well as consumer behavior  
421 shifts, can also promote convergence by blurring the demand structures of  
422 formerly distinct industries. Indeed, this is also particularly relevant to the FAB  
423 sector as changing consumer preferences around food are driving developments  
424 in sustainable agricultural practices, nutritional enhancement,  
425 preventative/functional properties, improved food safety and quality, etc.  
426 (McCluskey, Kalaitzandonakes, & Swinnen, 2016).

427  
428 Further promoting industrial convergence is the fact that as industries and  
429 technologies mature, dominant designs tend to emerge that drive the sector to  
430 switch from technical product innovation to process-based innovation (Abernathy  
431 & Utterback, 1978). While this can offer firms a competitive price advantage, it  
432 has the consequences of limiting new, potentially more innovative, entrants and  
433 technologies into the market and may even lead to commoditization of  
434 technology within a sector as price becomes the predominant product  
435 differentiator (Abernathy & Utterback, 1978; Maine, Thomas, & Utterback, 2014).  
436 This is also particularly relevant to the FAB sector as the food and agriculture  
437 markets tend to be highly mature, slow-to-adopt, and price-sensitive industries in  
438 which the pace of innovation has been significantly slower than other industries,  
439 i.e. information technology (Boehlje & Bröring, 2009).

440  
441 Given the duality of opportunity and challenge that convergent industries pose for

442 the FAB sector, how then do FAB ventures successfully identify and obtain  
443 product-market fit? One approach may be to utilize technology-market matching  
444 methods to prioritize the possible markets for platform or industry-spanning  
445 technologies (Maine & Garnsey, 2006). As the name implies, this approach aims  
446 to identify and evaluate technology and market barriers to establishing product-  
447 market fit (as discussed above). This innovation management capability also  
448 analyzes the critical interplay of such factors so as to facilitate finding product-  
449 market fit and guide initial commercialization efforts for ventures (**Table 3**).

450

451 Product-market fit is a function of technological and market uncertainties involved  
452 in innovation development and deployment. Examples of technology uncertainty  
453 include the need for complementary or process innovation (e.g. manufacturing  
454 innovation to produce technology at scale) and the need for customized design  
455 or R&D in order to implement the technology (Maine & Garnsey, 2006). In the  
456 context of the FAB sector, such technological uncertainty is likely to be  
457 influenced by inherent biological variability in living systems (i.e. crops/animals  
458 and raw materials/ingredients to which technologies are applied), geographical  
459 variability, and seasonal / climate influence (Boehlje & Bröring, 2009). General  
460 examples of market uncertainty include regulatory structures, the incumbent  
461 landscape and value chain positioning, a lack of trialability or visibility (e.g.  
462 technologies that cannot easily be demonstrated prior to financial commitment),  
463 and customer adoption rates (Maine & Garnsey, 2006). In the context of the FAB  
464 sector, such market uncertainty includes regulatory hurdles for approvals of novel  
465 foods, food ingredients, and food processing methods, veterinary regulations,  
466 environmental regulations, as well as a technologically conservative incumbent  
467 and customer landscape (Boehlje & Bröring, 2009), and economic constraints on  
468 value appropriability due to historically slim food and agriculture sector profit  
469 margins and/or commodity pricing structures<sup>3</sup> (Boehlje, 2004; Cahoon, 2007).  
470

---

<sup>3</sup> <https://assets.kpmg.com/content/dam/kpmg/pdf/2015/09/gvi-profitability.pdf>

471 Other specialized technological and market factors may offset technological and  
472 market uncertainties by positively facilitating the technology-market fit. Examples  
473 of such factors may include favourable incumbent alliance partners with key  
474 complementary assets, the presence of beachhead markets with champion early  
475 adopters (Rogers, 2004), markets with specialized incentives to adopt technology  
476 (e.g. legislation, subsidy or tax credits), or markets with specialized technology  
477 readiness (e.g. reduced need for complementary innovation and/or regulatory  
478 barriers) (Maine & Garnsey, 2006). Moreover, prioritizing markets with near-term  
479 potential in this way can not only provide ventures with technical visibility and  
480 credibility, but can also provide an important source of early revenue that can be  
481 applied to accessing longer-term and/or larger future markets (Maine, Lubik, &  
482 Garnsey, 2012).

483

484 A key determinant of product-market fit in convergent sectors (e.g. nutraceuticals  
485 and functional foods) is the availability of open innovation opportunities—i.e.  
486 sourcing innovation resources, such as technology, ideas and skills, externally  
487 through collaboration and partnerships, rather than developing competencies  
488 internally (Bröring, 2010; Chesbrough, 2003; Saguy & Sirobinskaya, 2014; Sarkar  
489 & Costa, 2008). Such opportunities mitigate inevitable deficiencies in the  
490 crossover of core competencies needed to compete in convergence-driven value  
491 chains (Bröring, 2010). In order to bridge such competency gaps quickly and  
492 effectively, companies need not only to analyze their existing core competencies,  
493 but also to continuously monitor technology and market developments and  
494 dynamic opportunities for open innovation (Bröring, 2010). Using such an  
495 approach to evaluate technological capability (i.e. R&D needs vs. current  
496 expertise) and market capability (required route to commercialization vs. current  
497 commercial channels) provides firms with a system to evaluate strategic options  
498 for acquiring required technology and market competencies, and thereby  
499 maintaining their dynamic capabilities (Teece, Pisano, & Shuen, 1997).

500

501 For instance, depending on a firm's current focus, i.e. technology development

502 vs. consumer goods marketing, and the anticipated new market competencies  
503 required, the innovation process may benefit from different types and degrees of  
504 inter-industry partnerships, from exploratory R&D partnerships to distribution  
505 alliances, to joint ventures. Indeed, instead of developing new competencies  
506 internally (costly), or relying only on existing competencies (limiting), firms may  
507 choose to maximize value creation and capture by broadly integrating  
508 themselves into the value chain. This requires that firms address the inevitable  
509 competency gap (e.g. a food company that has no previous experience in  
510 performing the clinical trials that are needed to empirically validate health claims)  
511 by forming strategic partnerships that enable a firm to develop the required  
512 competencies in an efficient way, i.e. fast-to-develop and low-cost (Bröring,  
513 2010). In the FAB sector, the utility of open innovation practices to bridge  
514 competency gaps has been documented ((Bröring, 2010; Saguy & Sirotinskaya,  
515 2014; Sarkar & Costa, 2008), and is of particular value to the sector since 1) it  
516 operates largely within the context of convergent industries; 2) its constituent  
517 markets—the food and agribusiness industries—tend to have highly  
518 interconnected value chains with a large number of stakeholders servicing a  
519 diverse range of interests including intermediate consumers, end-users,  
520 regulators, etc. (Sarkar & Costa, 2008); 3) it must continually address changing  
521 consumer needs and preferences, dynamic regulatory environments, complex  
522 retail landscapes, and a highly competitive time-to-market race (Saguy &  
523 Sirotinskaya, 2014). Thus, when establishing product-market fit, alliance  
524 opportunities are a critical consideration in the process of technology-market  
525 matching.

526

527 By critically analyzing the interplay between both positive and negative forces in  
528 the marriage of technology and market, FAB ventures can identify priority  
529 markets for their technology and expedite the establishment of product-market fit,  
530 thereby maximizing the chances of successful innovation. Indeed, this is of  
531 critical importance in the FAB sector as high commercialization costs and limited  
532 freedom for pivoting means that early choices often have substantial, path-

533 dependent consequences.

534

ACCEPTED MANUSCRIPT

**535 Conclusion**

536

537 By virtue of its role in innovating global food and agriculture, the FAB-sector  
538 faces specialized technology and market adoption uncertainty above and beyond  
539 that shared with other SBVs (Figure 1). In this commentary, we examined  
540 relevant innovation management and FAB sector literature to identify and discuss  
541 key barriers to successful FAB innovation, including 1) specialized adoption  
542 uncertainty stemming from organizational and social factors leading to consumer  
543 reticence towards biotechnology-enabled foods, and 2) challenges in obtaining  
544 product-market fit as a result of broad technology applicability and the  
545 specialized demands of operating in complex and interconnected value chains  
546 created through industry convergence and changing consumer preferences.

547

548 Through our examination of innovation management literature, we identified key  
549 overarching and complementary frameworks for strategic decision making that  
550 we believe to be well suited for addressing such barriers to innovation in the FAB  
551 sector. Firstly, FAB ventures may benefit from the utility of specialized  
552 uncertainty analysis methods, such as TCOS, as a means to identify and resolve  
553 barriers to the establishment of cognitive, and especially, sociopolitical  
554 legitimacy. Secondly, structured analysis of product-market fit through  
555 technology-market matching may help to prioritize beachhead markets and early  
556 adopters for whom sociopolitical legitimacy may be more easily established.

557 Such an analysis should prioritize the evaluation of open innovation  
558 possibilities—primarily determined by the availability and utility of 1) industry  
559 alliance partners and complementary assets, and 2) responsive consumers to  
560 engage with early in the development process—as a means to narrow gaps in  
561 absorptive capacity created by the need to establish technology legitimacy in  
562 convergent FAB value-chains.

563

564 The FAB sector must overcome considerable commercialization challenges the  
565 FAB sector must overcome in order to realize its potential. When managed

566 appropriately, risk and uncertainty can bring substantial reward, as the sector is  
567 poised to respond to some of society's most pressing challenges, including food  
568 security, climate change, population growth, and resource limitation. Through the  
569 proactive analysis and management of barriers to innovation, strategic FAB  
570 ventures can be successful in maximizing value creation and capture, as well as  
571 realizing the power of their innovations to positively change the world.

920

921 **Figure 1 | Positioning of technology sectors with respect to technological complexity and**

922 **consumer viewpoint.** Technological complexity refers to the magnitude of technical and  
923 commercial uncertainty associated with innovation in an industry. Consumer viewpoint refers to  
924 both the visibility of an industry to consumers, as well as the strength of vested consumer opinion  
925 in that industry. ICT – Information and Communications Technology; FMCG – Fast Moving  
926 Consumer Goods; F&B – Food and Beverage.

**Table 1 | Innovation and technology summary of FAB sector.** Adapted from AgFunder<sup>4</sup>.

<b>Innovation Category</b>	<b>Technology Description</b>
Agricultural Biotechnology	On-farm inputs for crop & animal ag including genetics, microbiome, breeding
Farm Management Software, Sensing and IoT	Ag data capturing devices, decision support software, big data analytics
Robotics, Mechanization and Equipment	On-farm machinery, automation, drone manufacturers, agricultural equipment
Novel Farming Systems	Indoor farms, insect, algae & microbe production
Supply Chain Technologies	Food safety & traceability tech, logistics & transport, food processing
Bioenergy and Biomaterials	Non-food extraction & processing, feedstock technology
Innovative Food	Alternative proteins, novel ingredients & supplements
Food Marketplace / Ecommerce	Online Farm-2-Consumer, meal kits, specialist consumer food delivery

949

<sup>4</sup> AgFunder—<https://agfunder.com/research/agtech-investing-report-2016>

Table 2 | FAB Sector-Specific Barriers to Innovation.

FAB Sector-Specific Challenges	Examples	Reference
Specialized adoption uncertainty	High price competition leading to high price sensitivity, especially in B2C food products,	(Bunduchi & Smart, 2010; Trott & Simms, 2017)
	High product failure rates leading to increased costs and reticence towards R&D expenditure, especially in B2C food products	(Fuller, 2016; Trott & Simms, 2017)
	Lack of consumer knowledge and perceived usefulness for biotechnology products	(Boehlje et al., 2011)
	Reticence towards genetically modified or bioengineered food and agriculture products, especially in Europe — need for sociopolitical legitimacy	(Bray & Ankeny, 2017; Gostin, 2016; Hess, Lagerkvist, Redekop, & Pakseresht, 2016)
	Low acceptance rate of novel raw materials and production technologies in food	(Frewer et al., 2011; Golembiewski, Sick, & Bröring, 2015)
	High consumer visibility—even for B2B innovations—due to strong consumer opinion driven by social, cultural, personal, and nutritional associations with food	(Falk et al., 2002; Huesing et al., 2016; Loebnitz & Bröring, 2015; McCluskey et al., 2016)
	Sensitivity to changes in government policy, consumer sentiment, lobbying interests	(Boehlje et al., 2011; Detre, Briggeman, Boehlje, & Gray, 2006)
Sensitivity to political instabilities, economic and health crises		(Boehlje et al., 2011; Detre et al., 2006)
	Discordance between industry- and consumer- acceptable appropriability regimes— consumer driven trend towards transparency at odds with historical use of trade secrets in industry — need for sociopolitical legitimacy	(Duarte Canever et al., 2008; Pant et al., 2015; Trienekens et al., 2012; Wognum et al., 2011)
Product-market fit - Platform technologies	Difficult product-market fit and business model requirements due to broad implementation of common tool sets and general-purpose technologies, especially in synthetic biology	(Gambardella & McGahan, 2010)
	Requirement for custom application development work to tailor platform technologies to different subsets of FAB sector, especially in broad based agricultural technologies	(Fuglie & Kascak, 2001)
Product-market fit - Industry convergence	High degree of market-driven convergence responding to changing consumer preferences and regulatory landscapes	(Berning & Campbell, 2017; Boehlje et al., 2011; Bornkessel, Bröring, & Omta, 2016; Bröring, 2010; Carocho, Barreiro, Morales, & Ferreira, 2014; McCluskey et al., 2016; Raiten & Aimone, 2017)

FAB Sector-Specific Challenges	Examples	Reference
	<p>High degree of technical convergence, especially in the areas of synthetic biology for alternative proteins, novel ingredients &amp; supplements, and agricultural biotechnology, including genetics, microbiome &amp; animal and crop breeding</p> <p>Large number of convergence-driven value chains and new industry segments created, which require cross-functional knowledge and complementary assets</p>	<p>(Boehlje &amp; Bröring, 2011; Bueso &amp; Tangney, 2017; Golembiewski et al., 2015; Lenk, Bröring, Herzog, &amp; Leker, 2007)</p> <p>(Bornkessel et al., 2016; Bröring, 2010; Bröring &amp; Leker, 2007; Boehlje:2011vp Cohen &amp; Levinthal, 1990)</p>
Biological variability	<p>Raw material/yield variability affecting transformation/processing using biological materials</p> <p>Geographical, environmental, and application (e.g. crop type) variability</p> <p>Long, slow production cycles for biological raw materials</p>	<p>(Boehlje et al., 2011)</p> <p>(Fuglie &amp; Kascak, 2001)</p> <p>(Boehlje et al., 2011)</p>
Complex knowledge base	<p>Integration and communication between distinct yet complementary scientific disciplines</p> <p>Management of complex open innovation relationships, especially academic-industry partnerships</p> <p>High degree of innovation enabled from technology convergence, thereby necessitating broad knowledge transfer</p> <p>High degree of innovation in which technology input for FAB sector is output of other science-based sectors</p> <p>Immature technology base with continual fundamental advancement, especially in biotechnology</p>	<p>(Brunswicker &amp; Hutschek, 2010; "Exploring effectiveness of technology transfer in interdisciplinary settings - The case of the bioeconomy," 2017; Golembiewski et al., 2015)</p> <p>(Golembiewski et al., 2015; Pellegrini et al., 2014; Saguy &amp; Sirovinskaya, 2014; Samadi, 2014)</p> <p>(Fitjar &amp; Rodríguez-Pose, 2013; Jensen, Johnson, Lorenz, &amp; Lundvall, 2007; Levidow, Birch, &amp; Papaioannou, 2013)</p> <p>(Ahn, Hajela, &amp; Akbar, 2012; Brunswicker &amp; Hutschek, 2010; Lane &amp; Lubatkin, 1998; Pavitt, 1984; Tatikonda &amp; Stock, 2003)</p> <p>(Golembiewski et al., 2015)</p>
Competing innovation goals	<p>Requirement to balance internal environmental, social, and economic (business) sustainability practices with consumer image</p> <p>Increasingly aware customer base demanding sustainable products and businesses</p>	<p>(Boehlje et al., 2011; Bröring, 2009; deVoil, Rossing, &amp; Hammer, 2006; McCluskey et al., 2016)</p> <p>(Boehlje et al., 2011)</p>

<b>FAB Sector-Specific Challenges</b>	<b>Examples</b>	<b>Reference</b>
Conservative markets	High degree of process-driven incremental innovation, especially for food manufacturing	(Aylen, 2013; Bunduchi & Smart, 2010; Cohendet, Llerena, & Simon, 2010; Trott & Simms, 2017; Vogel, 2011) (Trott & Simms, 2017)
	Historically low R&D spending on innovation initiatives	
	High number of large, capital-intensive incumbent firms, which drives high switching costs for novel technology (B2B)	(Bunduchi & Smart, 2010; Golembiewski et al., 2015; Trott & Simms, 2017)
	Entrenched brand identity leading to insecurity around customer responses of technology adoption	(Golembiewski et al., 2015)
Complex supply chains	Low number of early adopters, especially in commodity markets with slim margins	(Frewer et al., 2011; Golembiewski et al., 2015; Henchion et al., 2013)
	Competitive, relationship driven sales channels and retail environments (B2C innovation)	(Lambert, 2008; Trott & Simms, 2017; Wynstra, Corswant, & Wetzels, 2010)
Industry flux	Highly fragmented and uncoordinated supply channels with high degrees of interconnectedness	(Boehlje et al., 2011; Fritz & Schiefer, 2008; Trott & Simms, 2017)
	Increasing risk and uncertainty as nascent FAB sector continues to develop and respond to convergence challenges	(Boehlje et al., 2011; Boehlje & Bröring, 2011; Bornkessel et al., 2016; Bröring, 2010; Golembiewski et al., 2015)
	Increased competition for common resources, especially in raw-material inputs for bio-economy segment of FAB sector	(Boehlje & Bröring, 2011; Golembiewski et al., 2015)
Regulatory requirements	Continually evolving regulatory structures, consumer response, and competitive demands resulting from convergence-driven value chains	(Krimsky & Wrubel, 1996)
	Significant regulatory burden of proof for product safety, efficacy and utility	(Bansal & Garg, 2008; Boehlje et al., 2011; Bröring, 2010)
	Specialized market economics	(Boehlje et al., 2011)
Specialized market economics	Production and market price volatility in commodity markets	
	Commoditized industries, e.g. food, leading to slim margins and reduced capacity to innovate	(Lindgreen & Wynstra, 2005; Trott & Simms, 2017)
	Inelastic supply and demand pricing	(Boehlje et al., 2011)

Table 3 | Key innovation management approaches relevant to the FAB sector.

	<b>Innovation Management Approach</b>	<b>Primary FAB sector-specific challenges addressed</b>	<b>Description</b>	<b>Reference</b>
1	TCOS Uncertainty Analysis	<ul style="list-style-type: none"> <li>• Specialized adoption uncertainty</li> <li>• Conservative markets</li> </ul>	Evaluation of specific technological, commercialization, organizational, and societal factors driving cognitive and socio-political legitimacy barriers to innovation	(Hall et al., 2014)
1.1	Focused Uncertainty Analysis	<ul style="list-style-type: none"> <li>• Biological variability</li> <li>• Regulatory requirements</li> </ul>	Stage-gate, decision-tree, and/or real options uncertainty analysis	(Boehlje et al., 2011)
1.2	Leveraged Funding	<ul style="list-style-type: none"> <li>• Complex knowledge base</li> <li>• Biological variability</li> </ul>	Leverage specialized funding opportunities, i.e. non-dilutive government funding, domain-specific incubator/accelerator opportunities, and in-kind support (e.g. academic relationships), to facilitate technological R&D	(Beylin, Chrisman, & Weingarten, 2011; Maine & Seegopaul, 2016)
1.3	Strategic Timing	<ul style="list-style-type: none"> <li>• Industry flux</li> <li>• Specialized adoption uncertainty</li> <li>• Platform technologies</li> </ul>	Utilizing strategic timing for high-profile publications and broad blocking patents to attract partners and raise financing	(Maine & Thomas, 2017)
1.4	Supportive Organizational Culture	<ul style="list-style-type: none"> <li>• Competing innovation goals</li> <li>• Conservative markets</li> <li>• Complex knowledge base</li> </ul>	Fostering innovative culture through organizational leadership and management	(Barsh, Capozzi, & Davidson, 2008; Boehlje et al., 2011)
2	Technology-Market Matching	<ul style="list-style-type: none"> <li>• Platform technologies</li> <li>• Complex knowledge base</li> <li>• Specialized adoption uncertainty</li> </ul>	Prioritization of potential markets based on technology and market adoption risk so as to identify product-market fit	(Lubik, Garnsey, & Minshall, 2012; Maine & Garnsey, 2006)
2.1	Alliance Partnerships	<ul style="list-style-type: none"> <li>• Complex supply chains</li> <li>• Complex knowledge base</li> <li>• Specialized market economics</li> </ul>	Forge strong alliance partnerships that provide access to key complementary assets/resources	(Das & Teng, 1998; Eisenhardt & Schoonhoven, 1996; Maine & Garnsey, 2006; Maine & Seegopaul, 2016; Maine & Thomas, 2017)
2.2	Staged Commercialization	<ul style="list-style-type: none"> <li>• Platform technologies</li> <li>• Specialized market economics</li> <li>• Specialized adoption</li> </ul>	Sequential entrance into markets so as to maximize resource utility and mitigate risk and uncertainty in achieving high-impact	(Kalish, Mahajan, & Muller, 1996; Sinfield & Solis, 2016)

		uncertainty	innovation, i.e. 'lily pad' / 'waterfall' commercialization	
2.3	Strategic Appropriability	<ul style="list-style-type: none"> <li>• Platform technologies</li> <li>• Specialized market economics</li> <li>• Conservative markets</li> </ul>	Developing sector/ecosystem and technology-appropriate appropriability regimes and business models to allow for maximal value creation and capture	(Adner, 2006; Gans & Stern, 2003; Lubik & Garnsey, 2015; Teece, 1986; 2010)
3	Convergence-driven Value Chain Management	<ul style="list-style-type: none"> <li>• Industry flux</li> <li>• Industry convergence</li> <li>• Complex knowledge base</li> </ul>	Utilizing specialized strategies to inform management decision making and close competency gaps in convergent industries	(Bröring, 2010)
3.1	Open Innovation	<ul style="list-style-type: none"> <li>• Industry flux</li> <li>• Industry convergence</li> <li>• Platform technologies</li> </ul>	Extensive collaboration and broad networks of expertise with academia, key opinion leaders, and consultants so as to minimize costly knowledge gaps and subsequent internal expertise build out during technology development	(Chesbrough, 2006; Maine et al., 2014; Pellegrini et al., 2014; Sarkar & Costa, 2008)
3.2	Convergence and Value Chain Analysis	<ul style="list-style-type: none"> <li>• Industry flux</li> <li>• Industry convergence</li> <li>• Complex supply chains</li> </ul>	Critical evaluation of drivers for convergence so as to predict and proactively respond to industry convergence	(Boehlje et al., 2011)
3.3	DUI Innovation	<ul style="list-style-type: none"> <li>• Conservative markets</li> <li>• Competing innovation goals</li> <li>• Specialized market economics</li> </ul>	Learning-by-doing, by-using, and by interacting (DUI)' to facilitate innovation in low and medium technology industries	(Fitjar & Rodríguez-Pose, 2013; Jensen et al., 2007; Trott & Simms, 2017)
3.4	Specialized Knowledge Management	<ul style="list-style-type: none"> <li>• Complex supply chains</li> <li>• Complex knowledge base</li> <li>• Specialized adoption uncertainty</li> </ul>	Collaboration and cooperation across the value chain to transfer technical and market knowledge so as to close competency gaps—'in-context' analysis	(T. Brown, 2005; Golembiewski et al., 2015; Nussbaum, 2004)

**1 Highlights**

2

- 3       • Food and agricultural biotechnology is an promising emergent and  
4       growing sector
- 5       • The sector faces innovation challenges common to other science-based  
6       sectors
- 7       • The sector also faces specialized technology and market barriers to  
8       innovation
- 9       • These arise from the combination of technology uncertainty and consumer  
10      viewpoint
- 11      • Sector barriers can be overcome using overarching innovation  
12      management approaches
